Use of Cost Estimate Information

# Town Building Assessment Study and Capital Master Plan Town of Brimfield, Massachusetts

#### Introduction

Buildings or functions included in this audit are as follows:

Town Hall Town Hall Annex Library Senior Center Public Safety Building (Police, Fire and Ambulance) Highway Department

In 2013 DRA Architects with its team of engineers performed visits to each of the buildings and evaluated them to determine the types of improvements that will be necessary. Conversations were held with department heads and those in charge of maintenance. These improvements included such topics as:

Life Safety Health American's with Disabilities Compliance Site Issues Exterior Envelop Issues Building Interiors Energy and Water Conservation Hazardous Materials New Construction

With any renovation project it is necessary that International Existing Building Code be reviewed in light of the items of renovation work that are selected. In doing so it may be determined that other items of work will be necessary to achieve compliance.

Each of the improvements was then prioritized into the following categories:

Current Critical Potentially Critical Necessary – Not yet Critical Recommended

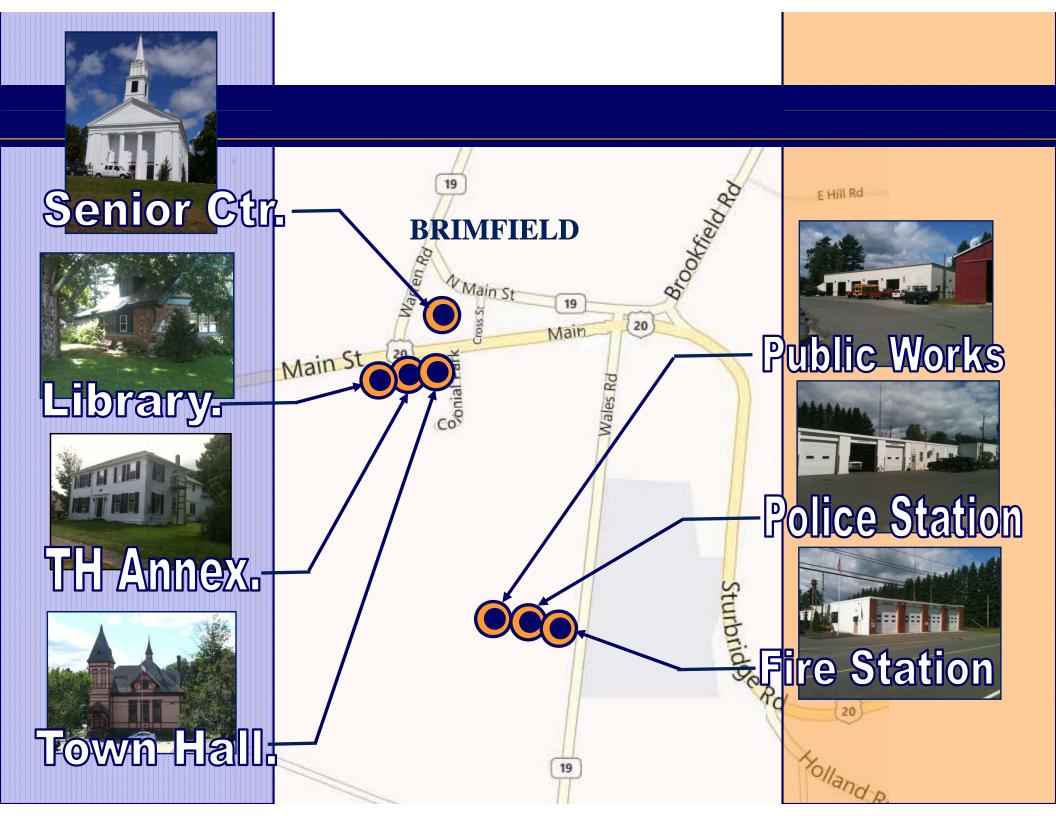

A detailed description of criteria used for each of the categories is included in the report.

For each of the improvements an independent cost estimate was obtained. The estimates are a projection of the costs and include soft costs associated with each item. (Soft costs are the miscellaneous costs associated with professional fees, contingency, bonding costs, bidding expense, testing etc.). The estimator does not have the advantage of detailed drawings for each of the items so

the intent is to provide an order of magnitude that, should the improvement move ahead, will be refined up to the bid date. For many of the like items it will be possible to group them together and save on the soft costs. Similarly, there may be items that can be bid without professional drawings and specifications and, again, the soft costs can be reduced. The cost should be used as an overall budget for each item. A more detailed explanation of the use of the estimates is included later in this report.

This report is organized with the recommendations presented first followed by the reports for each of the buildings from the various engineers each with the cost estimate for the work.

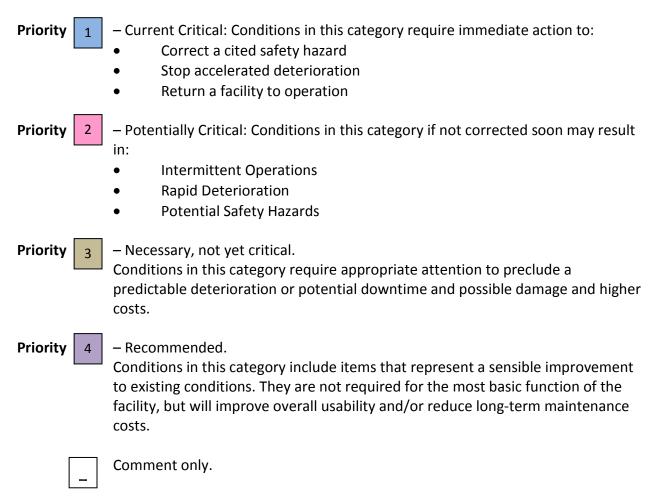

\* \* \*

# TOWN BUILDING ASSESSMENT STUDY AND CAPITAL MASTER PLAN Town of Brimfield, Massachusetts

# **Priority Rating System**

Priorities are listed to the left of each item:

# TOWN BUILDING ASSESSMENT STUDY AND CAPITAL MASTER PLAN Town of Brimfield, Massachusetts

# **Option Descriptions:**

#### Option #1

This option minimizes new construction to accommodate facility needs. Additions to the existing building will be required as indicated below.

#### Town Hall

Senior Center on upper two floors. Use of meeting room by boards and commissions. Police Department lower level. An addition is required for a stair and elevator. A storage building required in the parking lot to accommodate large evidence items.

#### Town Hall Annex

Single story addition to allow building to be used by all town administrative functions. Second floor unused.

Barn restored and integrated into design.

#### Library

Single story addition on east side to expand library space. Floor raised up in existing rear wing to allow for library to be on one level.

#### **Public Safety**

Building modified and expanded for Fire and Ambulance use. Police relocated to Town Hall.

#### **Highway Garage**

Building expanded for storage and vehicle wash bay.

#### Salt Sheds

Wood building modified to contain salt mixture and building repaired.

#### Option #2

This option includes the most new construction to accommodate facility needs. Additions to the existing building will be required as indicated below.

#### Town Hall

Senior Center upper two floors. Use of meeting room by boards and commissions. Lower level vacant. An addition is required for a stair and elevator.

#### **Town Hall Annex**

Rear of building demolished. Two story addition to allow building to be used by all town hall functions.

#### Library

Single story addition on east side to expand library space. Floor raised up in existing rear wing to allow for library to be on one level.

#### **Public Safety**

Building modified and expanded for Fire and Ambulance use. Police relocated to New Building.

#### **Highway Garage**

Building expanded for storage and vehicle wash bay.

#### Salt Sheds

Wood building modified to contain salt mixture and building repaired.

#### Option #3

In this option the buildings remain as-is and improvements are made to the buildings to resolve items listed in the building assessments. This is often referred to as the "Do Nothing" option as it does not resolve program deficiencies.

\* \* \*

Existing Buildings:		Priority 1			Priority 2		Priority 3		Priority 4			TOTALS

# BUILDING USE AUDIT Town of Brimfield, Massachusetts

# **COST SUMMARY**

The following is a summary of the costs associated with each building, both repairs and additions, and, where applicable, for new construction.

The Building Repairs are a total of all items listed in the building assessments. A separate chart is provided to show the costs associated to each of the priorities for each building. It is important to note that the Building Repairs have been priced as though each item was a separate project and as such the costs are inflated over what they would be if part of a large project. Please refer to "Use of Cost Estimate Information" included in Section 10 for more detail.

### Town Hall

Building Repairs:	\$ 4,484,713
New Entrance, Elevator and Stair:	\$ 1,101,993
Renovations for Police and Council on Aging:	\$ 4,950,392
Renovations for Council on Aging only:	\$ 3,367,584
Town Hall Annex	
Building Repairs:	\$ 1,388,785
New Single Story Addition: OR	\$ 4,097,709
New Two Story Addition:	\$ 5,883,732
Library	
Building Repairs:	\$ 1,050,512
New Addition:	\$ 2,147,612

# **Highway Department**

Building Repairs:	\$ 633,459
New Addition:	\$ 1,648,187
Salt Shed Repairs:	\$ 159,745

# **Public Safety Building**

Building Repairs:	\$ 1,348,365
New Addition:	\$ 3,594,340

New Police Building (in lieu of Town Hall Location): \$3,196,769

# New Building on New Site (to be selected)

Combined Town Hall, Senior Center and Police Station \$8,346,166 (Does not include cost of land or sale of current buildings)

For comparison note the following:

Town Hall Annex Renovation:	\$ 4,097,709	
Stair & Elevator addition to T	\$ 1,101,993	
Senior Center and Police in To	\$ 4,950,392	
	Total:	\$10,150,094
Town Hall Annex Renovation:	\$ 4,097,709	
Stair & Elevator addition to T	\$ 1,101,993	
Senior Center Town Hall:	\$ 3,367,584	
New Police Building:	\$ 3,196,769	
	Total:	\$11,764,055

# Code Implications for Repairs and Renovations to the Existing Buildings

The International Existing Building (IEBC) applied to the town's buildings and architectural recommendations addresses the requirements for the repair, alteration, change of occupancy, and additions to the studied buildings. The following is intended as a very basic guide only and before any work is undertaken the specific codes should be examined.

The studied town buildings have been previously, or are occupied and are therefore required to comply with the IEBC.

There are three compliance methods for these buildings:

#### 1. Prescriptive Compliance Method:

Previously known as Chapter 34 of the International Building Code (IBC) these provisions prescribe specific minimum requirements for the construction work. Routine maintenance and repairs (that would not require permits) do not fit under these requirements.

#### 2. Work Area Compliance Method:

These provisions are based on a proportional approach to compliance where upgrades are triggered by the type and extent of the work. There are three levels of alterations defined as follows:

#### **Alteration-Level 1:**

Includes the removal, replacement or covering of existing materials, elements, equipment or fixtures using items to serve the same purpose.

#### **Alteration-Level 2:**

Includes the reconfiguration of space, the elimination or addition of any door or window, the reconfiguration or extension of any system, or the installation of any additional equipment.

#### **Alteration-Level 3:**

This applies when the work area exceeds 50 percent of the aggregate area of the building.

#### 3. Performance Compliance Method:

This method provides for evaluating the building based on fire safety, means of egress and general safety. Using values for various building components a summary sheet is completed to show whether or not the work complies with this

section. There are mandatory scores required for fire safety, means of egress and general safety in order for the work to be acceptable.

Although part of the compliance methods, there are factors that need to be considered. Pertinent sections are described below.

#### Seismic Improvements:

In any of the above cases it will need to be determined if seismic improvements are necessary to the structure of the facility. This evaluation would be performed by a licensed structural engineer.

#### **Unsafe Buildings:**

Buildings that are unsafe are required to be taken down, removed or made safe. The Building Official needs to make this determination.

#### **Historic Buildings:**

Buildings may be exempted from items of compliance due to accreditation as a historic structure, but only when the lack of compliance will not constitute a distinct life safety hazard.

#### Fire Sprinkler Requirements (Alteration Level-2):

The addition of a sprinkler system to a building is often desired, particularly for historic structures. We include this paragraph as a guide to the requirements.

For the town occupancies with exits or corridors serving an occupant load greater than 30, fire sprinklers are required where the following occur:

- The work area exceeds 50 percent of the floor area.
- The building has sufficient municipal water supply for the fire sprinkler system without the installation of a new fire pump.

\* \* \*

# BUILDING USE AUDIT Town of Brimfield, Massachusetts

# THE NEED FOR SWING SPACE

The sequence of the renovations or additions to the Town's building must consider how continuous operations of the Town functions can be maintained during the work. The Town Hall is the only building that is not occupied, except for the offices of the Town Clerk, and therefore would be the best candidate as swing space for office functions.

Town functions could be located temporarily in Town Hall during construction work at the Town Hall Annex, but would require that either the Police Department or Senior Center renovations at Town Hall be delayed until the Annex is complete.

The addition to the Highway Garage would provide temporary vehicle bays for the Fire Department or Ambulance to allow a phased renovation of the Public Safety Building. Similarly, the new addition to the Highway Department would provide some swing space for the Highway Department renovations. A detailed phasing plan is necessary and consideration should be given to a temporary office space to reduce the time of the renovations.

In the renovated Town Hall option, the Police Department relocation is only dependent on vacated space in the Town Hall. This is the same for the Senior Center.

For the Library, the addition and renovations to the existing rear addition should be completed first to provide swing space during renovations to the original building. The wall between the original building and the additions should be made dust tight. A temporary storage trailer should be provided to house some of the collection during the renovations.

# BUILDING USE AUDIT - CONDITION ASSESSMENT Town of Brimfield, Massachusetts

# **Brimfield Town Hall**

#### 21 Main Street

Year Constructed:	1878	
Construction Type:	IV	
Fire Sprinklers:	No	
Building Area per Floor	:	
	Ground:	3172 SF
	First Floor:	3570 SF
	Second Floor:	576 SF
	Total Area:	7318 SF

Documents Used in Study: Assessor's Field Card Aerial Photograph

#### General:

There are a number of main challenges that need to be overcome to fully utilize the building. First is handicapped accessibility to the second floor. The current lift only provides access to the first floor. The fire escape at the rear of the building is also not a safe method of exiting the building. It is recommended that a new entrance with a stair and elevator be added to the rear of the building to serve all floors.

The basement area is damp and also faced with wood paneling creating an unhealthy and dangerous (respectively) environment. It is recommended that the wood faced partitions and wood floor be removed, and a new floor constructed with under drains and new sheetrock faced partitions be constructed.

#### **Ground Floor**

- Accessible entrance door is located on the south-east corner of the structure. Interior approach clearance on push side of door does not meet code. Add a push button operator to the door. (exterior & interior). (Not required if new entrance constructed).
- 2 Town Hall Annex parking lot drains towards Town Hall. Re-grade lawn area to provide a low spot at least 8 feet from Town Hall for the length of the west wall, with a gravel filled trench with a perforated drain running to the catch basin.

- On the exterior of the building there are two copper rain-leaders that are 2 broken, that connect to plastic pipes at grade. Replace plastic pipe and clean-outs and provide a sleeve that will allow expansion of copper.
- Brick and stone foundation needs re-pointing at grade. 2 (allow 20% of perimeter).
- Repair steps and isolate from foundation wall of building to prevent future 3 cracking.
- Foundation walls allow moisture into the building. Excavate adjacent 2 to building down to bottom of foundation walls. Provide a continuous perforated drain around building. Drain will probably need to be connected to a pumping station with the discharge at the higher catch basins. If foundations are irregular apply gunite to

smooth out surface. Apply damproofing over gunite with a drainage stone extending from grade to drain wrapped in filter fabric. Back-fill area. Patch paving where disturbed.

It appears that the foundation walls are the primary source of moisture but if this proves not to 2 be the case then the following action will be necessary:

> Remove wood flooring and concrete slab. Provide an under-floor drainage system connected to the pumping station described for the foundation drains.

Provide a minimum 6 inch thick stone base and place new concrete slab at a single level throughout basement. Slab needs to include insulation below and a vapor barrier.

- Wood faced partitions are not code compliant and need to be removed. 2 Demolish interior wood faced partitions in basement and construct new partitions that are faced with moisture resistant sheetrock.
- Foundation wall needs to be insulated. After drainage system is 3 installed and wall has dried out apply sheetrock faced metal studs and insulation over perimeter walls. this will cover all exterior wall plaster failures.
- Remove loose paint from exposed pipes below ceiling in the lift and 3 ramp area and repaint.

- Add storm panels to (14) existing single pane wood windows (double hung / fixed) including 3 some with metal bars (interior). This approach will be considerably less than replacement of the windows with historically accurate windows.
  - In Mechanical #1 patch openings and repair damaged areas to gypsum board ceiling and seal all duct penetrations in ceiling.
- In Mechanical #1 the exterior stone foundation wall and the 2 first 2 course of brick are deteriorating due to water infiltration. These walls show numerous repairs made over the years. This area of the room has a sump pump in the floor slab and at the time of the inspection there was water on the floor. Replace damaged brick and re-point existing brick chimney for the first 4' above the slab.
  - In Mechanical #2 patch openings and repair damaged areas to gypsum board ceiling and seal all wall penetrations with fire caulk.
- In Mechanical #2 the exterior stone foundation wall and the first 2 course of brick are 2 deteriorating due to water infiltration. Re-point upper part of interior face of wall.
  - Exterior wall next to lift is damaged. Repair wall and paint to match existing.
  - Seal all pipe and duct wall penetrations throughout Ground Floor. This includes fire caulking at rated partitions. (Corridors, Boiler Room, etc.)
  - More than half of the 17 interior doors do not meet the minimum width required by ADA. Enlarge door openings as require and install new door and hardware.
  - All interior doors are not equipped with lever hardware except for Elevator Lift door. Replace hardware to meet code on existing doors to remain.

2

2

3

3

3

3

2 Walls and ceilings in Toilet Rooms #1 & #2 have water damage and stains. Following successful repairs to exterior walls remove deteriorated plaster, add furrings to wall and new moisture resistant sheetrock over a vapor barrier. Paint walls and re-install toilet room accessories and fixture.

2

2

Unprotected step down from elevated wood floor in Corridor #2 to area in front of Unassigned #7 Room. Also, the wood ramp from Corridor #2 to Corridor #3 appears

to have a slope greater than 1in12 and has no handrails. Door to Mechanical #1 from Corridor #3 is blocked by the ramp. Add new wood floor construction to resolve transitions between areas and to replace ramp.

Chase wall exposed by opening in wall by ramp. Infill opening from floor to ceiling.

2 Brick / concrete steps and metal pipe handrail to exterior door in Corridor #3 are not to code. Remove and replace with larger platform and steps that will also provide

space around column at bottom of stairs. (See next item).

- Clearance between bottom of stairs, column and steps to exterior is too narrow.
   Create new landing flush with sill of exterior door and aligned with tread of stair.
   Landing to have steps down to floor with handrails.
- 2 There is a existing oil tank located in under the main egress stairs. This needs to be relocated out of the stair tower.
- 2 In both stairs up to the First Floor the existing riser/tread ratio and handrails do not meet code. the stairs also have projecting nosings. Retain existing stairs. Add new handrails. Infill area under nosings to meet ADA.

#### **First Floor**

All interior doors are not equipped with lever hardware . Replace hardware to meet code.

All exterior door hardware is old and out dated. Replace hardware to meet ADA and add closers to doors.

- 4 Several locations in the Meeting Room have water stains on the wall or at the intersection of the wall & ceiling. it is assumed that these are from previous water leaks and that repairs have been made. Repaint stained areas with stain blocker and topcoats to match existing.
- 4 The existing curtain for the stage appears to be in poor condition. The majority of the curtain is in the attic where the pully system, for raising and lowering the curtain, is located. At this time restoration has not been included, but it is recommended that the curtain be removed and the remaining ceiling opening be covered with sheetrock as it is open to the attic.
- 3 Add interior storm panels to (15) existing single pane wood windows (double hung / fixed) and replace broken panes of glass.
  - There are minor splits in the panels and slightly open joints in the rails of the exterior doors in the Meeting Room. Fill splits and open joints and repaint doors.
  - Thresholds are too high. Remove and replace existing wood thresholds at both interior double doors from the Meeting Room.
  - Install new handrails at both stairs up to the Stage in the Meeting Room.

3

3

3

Repair wall and ceiling damage (cracks) in Storage #3.

Replace existing wood handrail in both Storage #2 and #3 with new to meet code.

Repair wall (water stains) and ceiling damage (cracks) in Town Clerk #1 .

Repair wall (water stains) and ceiling damage (cracks) in Lobby.

The handrails and guardrails on the egress stair located in the Lobby do not meet code and require replacement. Also the tread/riser ratio is not to code but is grandfathered.

Sand and refinish wood floors and stairs. Remove and replace non-slip adhesive strips on stairs.

3

This floor is handicapped accessible, but has no accessible toilet. Install a new handicapped accessible toilet.

#### Second Floor

Add interior storm panels to (5) existing single pane wood windows (double hung / fixed) and replace broken panes of glass.

Ceilings in the Meeting Room, Stair and Attic access all have water stains and damage/patches. Repair as required and re-paint.

Sand and refinish wood floors and stairs. Remove and replace non-slip adhesive strips on stairs.

The stair handrails and the projecting nosings do not meet ADA. Add new handrails and add tapered wood under nosings.

3

Replace vinyl asbestos tile in attic access space.

The following are items noted in the review of the building that will be addressed if the new layout for the second floor is implemented:

This floor is not handicapped accessible. Add an elevator to serve all levels and remove lift. In addition add a new egress stair.

#### Attic

1

Insulate attic floor with blown-in insulation. Add attic ventilation.

Remove bird/bat droppings from belfry. Seal up openings to prevent future bird/bat access.

#### Exterior

Re-attach gutter on the east side of building.

PVC rainleaders are broken. Replace damage sections. Replace damaged Brick.

- At front stairs, retain existing 24" high railing and add a new 42" high guardrail on the landing side of the railing.
- Secure lose metal handrails (3) at front entrance stairs.
- Sand and refinish wood front entrance stair. Remove non-slip strips, re-paint and apply new strips.
- Paint is peeling around entire structure. (siding, trim, window/door trim, fascia boards 3 & porch) Scrape and repaint areas where peeling paint occurs(approximately 5%)
  - At front porch roof to wall intersection, cut wood siding back 1" from roof shingles. paint cut edges of siding. Verify existence of metal flashing. If none, install new.
  - Re-point (3) brick chimneys completely. Re-set stone chimney caps.
  - Replace missing boards from two finials and re-paint.
  - Replace flat roof area at second floor.
  - Insulate exterior walls with blown-in insulation on First and Second Floors.

#### Mechanical

Replace the steam boiler plant with a hot water circulating plant and provide new hot water 3 radiation equipment in place of the steam radiators for better control and comfort.

2

3

3

3

2

2

3

4

Replace all oil fired equipment with gas fired equipment for decreased energy usage due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).

3

Replace existing thermostats with programmable type.

3

Provide new oil supply lines with code approved jacketing/membrane to each of the furnaces since currently neither of these lines includes this.

3

Provide mechanical ventilation using an automatic louver/damper system to serve both of the furnaces serving the ground floor and the main meeting chamber.

Reconfigure the ductwork of the inline dehumidification unit to draw from and supply back to the supply main from the furnace this unit is serving. As currently configured, there is a good chance that the unit could be short-circuiting air across the furnace then back through the dehumidifier which may explain why the unit was overflowing and not operating at all. Additionally provide interlock wiring such that the unit only operates when the furnace fan is on and also to shut down the unit upon detection of moisture in the overflow drain pan.

#### Electrical

- 4 Upgrade the lighting throughout the building to more energy efficient types with better light distribution and quality.
- 2 Review the coverage of the exit and emergency lighting and provide additional fixtures where required. Replace the existing fixtures with new energy efficient LED types.
- 2 Provide a new emergency generator with an automatic transfer switch.

#### Plumbing

- 3 The well pump and the expansion tank for the pump should be replaced.
- 3 The electric water heater should be replaced.
- 4 The laundry tub should be replaced.
- The water closets should be replaced with low flow fixtures.

#### Fire Protection.

2 The building does not have a sprinkler system. A system should be added to the building incorporating a storage tank and a generator or diesel powered fire pump. If the proposed plan incorporating the Police Department is implemented the generator for the Police can be designed to include the sprinkler system.

# **PROGRAM INFORMATION**

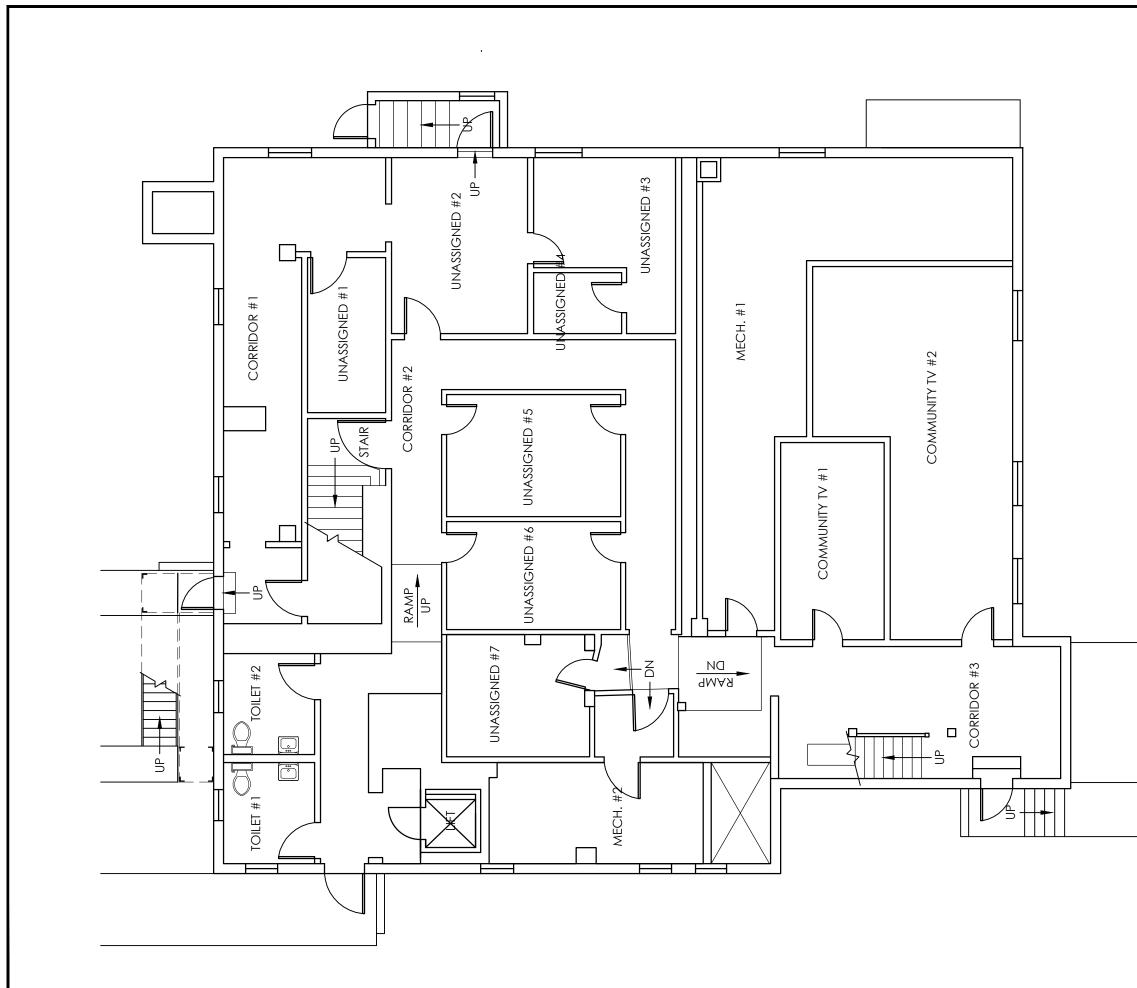

With the exception of the Town Clerks offices the building has no occupants. Some spaces in the basement are used by the Police Department for storage.

If all floors were made suitable for occupancy and accessibility the building could be efficiently utilized. Also have a fully used building will made energy use more efficient by not having to heat an unoccupied building.

Reviewing the needs of the Town the Senior Center appeared to be the best fit for the first and second floors, but also would maintain the historic character of the interior spaces. An elevator and egress stair would be added to serve all levels.

The previous occupant of the lower level was the Police Department but dampness is a problem for continued use of this space. With the moisture removed the space could be returned to serve the Police Department again. This use would need to be supplemented by a metal building for large evidence storage.

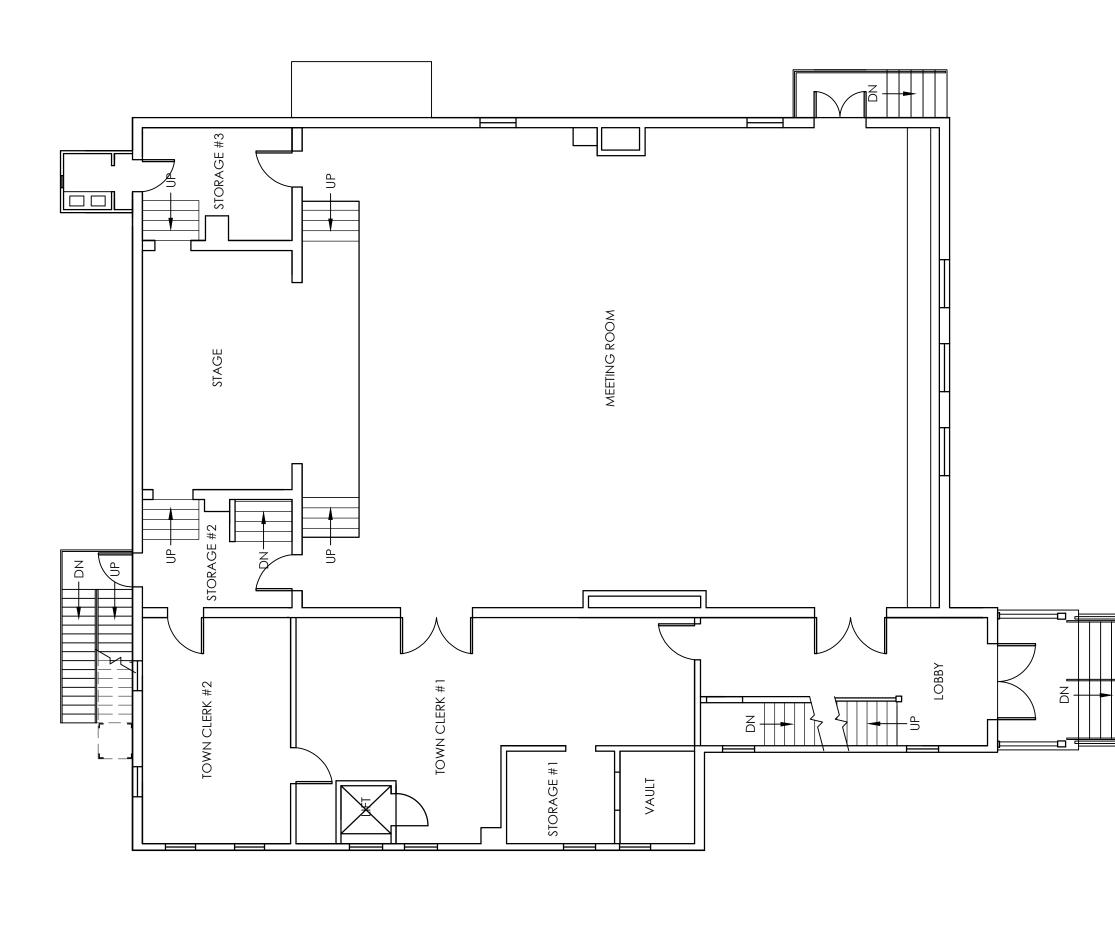

The test fit plan includes both the Senior Center and Police Department within the Town Hall building. A new entrance at the rear of the building will provide elevator and stair access to all levels from the parking lot.

## SECOND FLOOR PLAN

### MUNICIPAL FACILITIES STUDY AND PLANNING Town of Brimfield, Massachusetts

### **Town Hall**

Structural

### Structural Description:

The Brimfield Town Hall is a two-story, wood framed structure (plus a walkout Ground Floor level), located at 23 Main Street in Brimfield. The building was constructed in 1878 and is listed on the National Register of Historic Places.

The Town Hall is rectangular (nearly square) in plan. Program elements at the Ground Floor include Town Offices, Police Offices, the Public Access Television Station, Bathrooms and Storage. The Ground Floor level is serviced by stairways at the back (south) side and at the northeast corner (at the front entry), and by a LULA elevator at the southeast corner of the building. The Selectman's Office and Town Clerk are located at the First Floor. The two-story Hall/Meeting Room and (elevated) Stage occupy the western two-thirds of this level. A partial Second Floor was constructed along the eastern one-third building, adjacent to the upper Hall. The Planning Center and the Cable Board Office are located at this level, between a flat roof section in the back of the building and the front entry stairway (this level currently get little or no use). Roof forms consist of hips and gables; an entry tower accents the front, northeast corner of the building.

Typical foundation walls are rubble stone with brick masonry upper sections. Ground Floor construction is a concrete slab on grade (thickness unknown); a wood floor (with shallow ramps) was constructed over the southern half of the Ground Floor, reportedly to address water issues. Floor and roof construction was mostly obscured by finishes; no exploratory demolition was conducted to determine floor and roof construction framing sizes/details. First and Second Floor construction is wood framed (2x10 joists observed in several locations) supported by timber beams (6x10 and 10x10 beams observed) and interior brick masonry bearing walls (8" thick) at the Ground Floor. Roof construction consists of

wood rafters spanning (up the slope) to timber purlins. The timber purlins span across the roof slope and are supported by timber trusses, which clear span the Hall below. Exterior cladding is wood siding on wood framing. The present roof is asphalt shingles.

No original construction drawings for the building or previous structural reports were available.

### Structural Conditions/Issues – Comments and Recommendations:

Structural conditions at the Brimfield Town Hall were observed (to the extent possible) during a brief tour of the facility on May 13, 2013. Generally speaking, floor and roof construction appears to be performing satisfactorily; there is no evidence of structural distress that would indicate significantly overstressed, deteriorated or failed structural members. Foundations appear to be performing adequately; there are no signs of significant, total or differential settlements.

Structural/structurally related conditions observed during site visit are noted below:

 The condition of the exterior wood siding appears to be generally satisfactory. Exterior, brick masonry joints appear to be in satisfactory condition as well. The spire at the top of the tower has deteriorated and is open to weather (as is another, centrally located spire).

- The capacity of the First and Second Floor framing was not determined; however, floor construction appears to be relatively stiff and is functioning as originally intended.
- The capacity of the roof framing was not determined; however, roof framing appears to be functioning as originally intended. Repair/reinforcing of roof trusses has been conducted in the past.
- As noted above, there have been water issues at the Ground Floor. Rubble stone and brick masonry foundation walls show evidence of water infiltration as well. Roof and perimeter drainage issues should be evaluated, in conjunction with future renovations to the facility.

• Wood framing may typically be protected (to a degree) by the ceiling construction; however, elsewhere it is unprotected. There are no sprinklers. Fire rating requirements should be reviewed in conjunction with future renovations to the facility.

### **Building Code Requirements and Additional Comments:**

### Massachusetts State Building Code Requirements – General Comments:

Proposed renovations, alterations, repairs and additions to the Brimfield Town Hall would be governed by the provisions of the Massachusetts State Building Code (MSBC – 780 CMR 8<sup>th</sup> Edition) and the Massachusetts Existing Building Code (MEBC). These documents are based on amended versions of the 2009 International Building Code (IBC) and the 2009 International Existing Building Code (IEBC), respectively.

The MEBC allows the Design Team to choose one of three (3) compliance methods. Structurally, the Prescriptive Compliance Method is preferred. Section 101.5.4.0 of the Massachusetts Amendments (Chapter 34) would require that the existing building be investigated in sufficient detail to ascertain the effects of any proposed work (or change in use) in the area under consideration, and the entire building or structure and its foundations, if impacted by the proposed work or change in use.

### Additions - General Comments:

The design and construction of any proposed additions would be conducted in accordance with the Code for new construction. Significant additions should be structurally separated from the existing building by an expansion (seismic) joint to avoid an increase in gravity loads and/or lateral loads to existing structural elements. Smaller additions can be structurally attached to the existing building, provided they do not increase the demand - capacity ratio of the existing lateral force resisting elements in the building by more than 10%.

### Renovations/Alterations – General Comments:

Where proposed alterations to existing structural elements carrying gravity loads results in a stress increase of over 5%, the affected element would need to be reinforced or replaced to comply with the Code for new construction. Proposed alterations to existing structural elements carrying lateral load

(perimeter wood walls and Ground Floor masonry walls) which result in an increase in the demand - capacity ratio of over 10% should be avoided, if possible. Essentially, this means that removal of, or major alterations to these walls should be minimized. If this is not avoidable, more significant seismic upgrades/reinforcing will be required; potentially including the addition of lateral force resisting elements (wood shear walls, etc.).

### **End of Structural Report**

TOWN BUILDING ASSESSMENT STUDY AND CAPITAL MASTER PLAN Town of Brimfield, Massachusetts

### Town Hall

21 Main Street

MECHANICAL, ELECTRICAL, PLUMBING, AND FIRE PROTECTION SYSTEMS

Prepared By: Consulting Engineering Services 510 Chapman Street, Suite 201 Canton, MA 02021

July 3, 2013

### GENERAL

The mechanical, electrical, plumbing, and fire protection systems were reviewed in conformance with the requirements of the following State and National codes and regulations, as applicable:

- Massachusetts State Building Code 8th Edition
- Massachusetts State Fire Prevention Regulations
- NFPA Latest Editions
- Massachusetts Plumbing Code
- Massachusetts Mechanical Code
- Massachusetts Electrical code (NEC 2011 Edition)
- Illuminating Engineering Society of North America (IESNA) Lighting Handbook
- ASHRAE 90.1 Latest Edition

The scope of this study does not include operational assessment of the fixtures and equipment reviewed; it includes only a brief visual review of the fixtures and equipment. Therefore notes regarding the condition of the fixtures and equipment may or may not be indicative of the actual condition of the systems and equipment and/or the expected life of the fixtures and equipment. Therefore it is recommended that services of a qualified technician be retained to evaluate the actual condition of fixtures and equipment prior to replacement.

### MECHANICAL

### HEATING

The main meeting chamber on the first floor is served by an oil fired, gravity vent, hot air furnace in the mechanical space on the ground floor with supply registers ducted to floor mount supply registers along the perimeter and underneath a built in bench seat along the front of building and return ducted from floor grilles in the middle of the chamber. Miscellaneous rooms on the ground floor including the public access television room are served by a smaller oil fired, gravity vent, hot air furnace with over head supply distribution ductwork.

Both units appear to be 20+ years old and are in poor condition. Each is piped independently to a single 275 gallon oil tank within the same room with fill and vent piping connections through the adjacent exterior wall on the side of the building. Each unit is controlled by a dedicated wall mounted dial thermostat.

The remainder of the building is heated with two-pipe steam radiators fed from an oil fired steam boiler in another mechanical room on the ground floor. The boiler is supplied from its own 275 gallon oil tank in an adjacent room with fill and vent connection piped through the exterior wall locally. The radiators are controlled by local manual valves at each. The boiler and steam distribution is old and in poor condition, specifically within the mechanical room itself.

There are small lengths of electric baseboard in the two restrooms at the rear of the ground floor.

### AIR CONDITIONING

There is no central air conditioning system in the building. There is a new inline dehumidification unit ducted in parallel with the supply and return lines to/from the smaller furnace serving the ground floor spaces. This unit has a small condensate pump adjacent to it with the discharge tube piped to the exterior of the building through an old window opening.

### VENTILATION

There is no mechanical ventilation system in the building but there are operable windows throughout that appear to be of adequate free area to meet the natural ventilation code requirements, except in the main meeting chamber where the required rates are much higher and in on the ground floor where the windows are very small and in some cases not operable.

There are ceiling cabinet fan/light combination units in each of the ground floor bathrooms.

### RECOMMENDATIONS

Replace the steam boiler plant with a hot water circulating plant and provide new hot water radiation equipment in place of the steam radiators for better control and comfort.

Replace all oil fired equipment with gas fired equipment for decreased energy usage due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).

Replace existing thermostats with programmable type.

Provide new oil supply lines with code approved jacketing/membrane to each of the furnaces since currently neither of these lines includes this.

Provide mechanical ventilation using an automatic louver/damper system to serve both of the furnaces serving the ground floor and the main meeting chamber.

Reconfigure the ductwork of the inline dehumidification unit to draw from and supply back to the supply main from the furnace this unit is serving. As currently configured, there is a good chance that the unit could be short-circuiting air across the furnace then back through the dehumidifier which may explain why the unit was overflowing and not operating at all. Additionally provide interlock wiring such that the unit only operates when the furnace fan is on and also to shut down the unit upon detection of moisture in the overflow drain pan.

### ELECTRICAL

### **EXISTING SYSTEMS**

The existing building is served by a single 100amp, 120/240volt electric service. The service is overhead from a local utility company pole.

The service equipment consists of a 100amp, 240v-3p disconnect switch. From that switch there are (2) normal power panels and (2) emergency power panels. The emergency power panels are fed thru a manual transfer switch.

The equipment is approximately 20 years old and in fair condition.

The building has a gasoline powered generator located in the boiler room. This is a very old piece of equipment rated 3950watts at 120volts, single phase. It appears that if this is used, extension cords a plugged into it from electrical loads desired to be on emergency power. With the configuration of the emergency power panels and the fact that the police department once occupied the building, it is more likely that a portable generator was brought to the building and connected rather than use the unit in the boiler room.

The lighting in the building consists of surface mounted wraparound fluorescent fixtures, pendant mounted fluorescent strip fixtures, and original fixtures with incandescent lamps. Some of the small local light fixtures have had compact fluorescent screw-in lamps installed. The lighting in the building is in fair to poor condition and the lighting levels appear to be low.

The emergency lighting consists of individual self-contained battery units or similar fixtures attached to exit signs. This equipment is in fair condition and the coverage should be reviewed and additional fixtures added where necessary.

The exit signs are a mixture of older incandescent and newer fluorescent fixtures. This equipment is in fair condition. The coverage should be reviewed and additional exit signs added where necessary.

The building does have a fire alarm system manufactured by General Electric. This system consists of manual pull stations, smoke and heat detectors, horn/strobe units and a dialer which is manufactured by Silent Knight. This equipment is in fair condition.

There is evidence of the original knob-and-tube wiring in the attic space. This wiring is disconnected and no longer in service.

### RECOMMENDATIONS

Upgrade the lighting throughout the building to more energy efficient types with better light distribution and quality.

Review the coverage of the exit and emergency lighting and provide additional fixtures where required. Replace the existing fixtures with new energy efficient LED types.

Provide a new emergency generator with an automatic transfer switch.

### PLUMBING

### EXISTING SYSTEMS

Cold water is from a well. The pump for the system is in the boiler room, and it appears to be in poor to fair condition. The compression tank for the system is adjacent to the pump, and it appears to be in fair condition.

The exposed water piping in the basement is copper, and it appears to be in fair to good condition.

A tank type electric water heater provides hot water for the building. It appears to be in fair condition, however a hand marked date on the housing indicates that the heater is over 30

years, which is well beyond the life of a typical electric water heater, therefore the water heater should be replaced.

The laundry tub in the water heater room appears to be in fair to poor condition.

The water closets in the two restrooms are the floor mount vitreous china tank type units, they are accessible, and they appear to be in good condition. The water closets are not low flow.

The lavatories in the two restrooms are the wall mounted vitreous china type, they are accessible, and they appear to be in fair condition.

There are three grade mounted propane tanks. The appliances served by those propane tanks were in spaces that were locked during the walk-thru, so this study does not include such information.

There is a sump pump in the furnace/oil tank room.

### RECOMMENDATIONS

The well pump and the expansion tank for the pump should be replaced.

The electric water heater should be replaced.

The laundry tub should be replaced.

The water closets should be replaced with low flow fixtures.

### **FIRE PROTECTION**

The building does not have a sprinkler system.

# BUILDING USE AUDIT - CONDITION ASSESSMENT Town of Brimfield, Massachusetts

# **Senior Center**

20 Main Street

The current Senior Center is located in rented space on the first floor of the First Congregation Church opposite the Town Hall.

## General:

Plans were developed to ascertain the useable floor area for the Senior Center.

As this is not a town Owned facility a condition assessment was not performed.

## Program:

The Senior Center is located in one large room that has use of the kitchen. This space houses all the functions. There are no private offices but a small room is available should a private conversation be required.

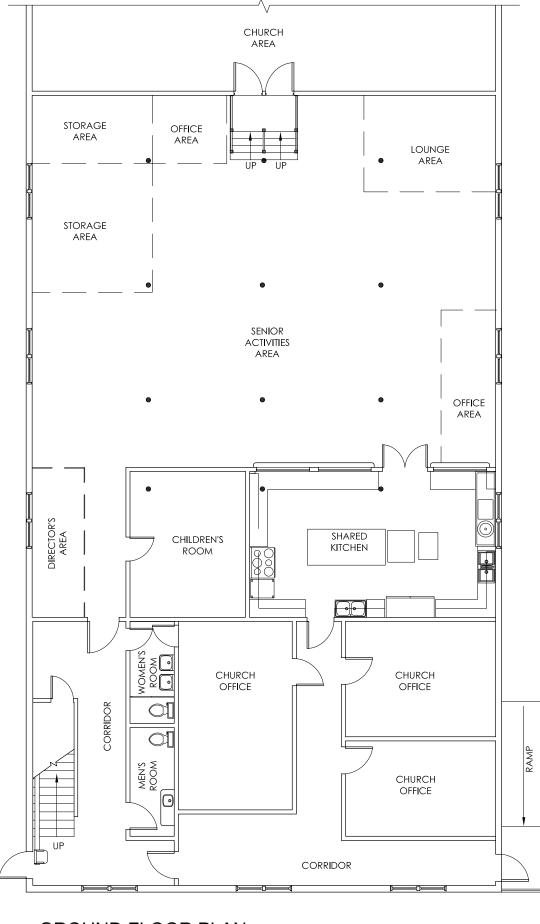

A design for a new Senior Center was previously developed and located to the rear of the Town Hall Annex. The building would have incorporated the Annex Barn, and the link from the Barn to the house would have been demolished. This approach was not pursued due to issues with the well. We chose not to include this as an option as it will preclude the use of the Town Hall Annex.

The Town Hall building has most of the features required for a Senior Center including a large meeting space and smaller office areas on the first and second floor that can accommodate the requirements for this function. A proposed layout for this option was developed. Senior activities typically occur during the mornings. The meeting space could be used by other Town functions requiring a large space in the evening. These could include Historical Commission meetings, training or public informational meetings that are currently accommodated at the HItchcock Academy. Concerns with this include the ability to secure

Senior Center items. This could be overcome with moveable lockable pods (closets) for the Senior Center items.

In conversations with Conservation there is minimal space available in the Town Center for new construction. If buildable Town land is available elsewhere an option for a new building could be pursued.

REFER TO THE TOWN HALL DOCUMENTS FOR PROPOSED PLANS.

# General:

# The building is not handicapped accessible:

G Entrance door is located on the east side of the structure and approach is very narrow (4'-3"). Approach clearance on pull side of door does not meet code.

It appears that the ramp in the approach area is more than a 1/12 slope. Changes will be cost prohibitive.

3 Concrete Ramp from parking to the main entrance is badly deteriorated and in need of replacement. Steel structure and exposed rebar rusted. Hand rails are rusted and to low (30" high) without extensions. There is no toe kick on the railings. Ramp should be demolished and a replacement ramp constructed.

Re-point brick chimney and provide a stainless steel cap.

Paint is peeling around entire structure. Scrape and repaint areas where peeling paint occurs.

Roof damage above main entry at skylight. Blue tarp visible in this area. Repair flashing and roofing at skylight.

- Side entrance concrete steps and landing that are pulling 3 away from the building. They have a rise of 8" and a 4" step in to the building. Metal handrails and railings are low (30") without extensions. It is recommended that steps be removed and door secured shut. Behind the steps is a window into the basement. this should be cleaned and painted.
- Main Street (North) entrance has a 8" step into building and the concrete 3 stoop is not deep enough for the approach. (2'-4" x 7'-0"). Board from facade missing from below door. Replace stoop with new brick stoop aligned with floor at least 6'-0" deep with steps and railings down to side walk.
  - Wood rot apparent at grade on extension to barn both sides.
  - Replace missing fascia boards and trim from areas around entire structure.

Unused concrete stairs on west side of structure. No action recommended.

Foundation wall cracked around west side of building. Re-point wall areas.

3

3

3

3

Brownstone facing to east side of foundation has shifted under bay windows. Re-set stone.

Fire escape made of a wood structure on the west side of the building is unusable. Remove platform and patch siding.

Due to status of second floor construction (see structural items below) all doors locked and warning signs installed to prevent use of second floor spaces.

In the Meeting room, exterior door from vestibule does not meet required push side area. Remove vestibule and secure door shut.

Window shutters need repair and replacement of missing louvers.

Rest room is not ADA compliant (area, door knobs and plumbing). One ADA restroom is provided so no action required.

Paint peeling and water damage throughout. Make repairs to roof.

Ceiling cracks and damage throughout entire second floor.

Floors throughout first floor are uneven, either sloping or bowing. (See structural report) Floor areas need to be reinforced structurally or fully replaced.

3

3

2

3

3

3

Stair handrail to second floor is loose and needs to be repaired and resecured.

Threshold into Tax Collectors office is raised and not ADA compliant. Replace threshold.

Cemetery Commission office has an opening in the ceiling covered and taped 3 with plastic. Replace damaged section of ceiling.

# **STRUCTURAL**

- First Floor framing over the Basement be thoroughly evaluated and 3 reinforced/permanently re-supported in conjunction with future renovations to the building.
- First Floor framing over the crawl space be thoroughly evaluated and 3 reinforced as required to increase capacity for the intended use, in conjunction with future renovations to the building. In the meantime, caution should be exercised in placing heavy loads (file cabinets, equipment, etc.) in these areas.

Roof and surface drainage needs to be evaluated in conjunction with future renovations 3 to the building. Roof and surface water should be directed away from foundation walls and wall joints should be raked and re-pointed as required.

Second Floor framing be thoroughly evaluated and reinforced as 3 required to increase capacity for the intended use, in conjunction with future renovations to the building. In the meantime, caution should be exercised in placing heavy loads (file cabinets, equipment, etc.) at this level.

Hip roof framing over the northern section of the original house is performing satisfactorily; however, it is somewhat undersized with respect to current code requirements.

Review and reinforcing of these areas is recommended, in conjunction with future renovations to the building. In the interim, maintenance personnel should clear drifted snow, should it accumulate during the winter months.

Further review of exterior walls is recommended, in conjunction with future renovations to the building.

- 3 The handicap ramp on the east side of the original house needs to be replaced.
- 1 The supporting post for the central, north- south Loft Floor beam in the Barn has been removed. In the absence of the column, this beam has little or no live load capacity. FBRA recommends that the beam be temporarily shored, without delay. Loft Floor joists in the western bay (right hand side in photo at right 3"x4½" @ 2'-6" o.c., spanning 10½ +/-feet) have minimal live load capacity and have deflected considerably. Joists in this bay be temporarily shored and/or that (storage) loading be removed.

- The capacity of the wood framed First Floor in the Barn was not determined; however, the floor is considerably uneven throughout, suggesting that there may be damage and/or deficiencies present. These need to be investigated and corrected.
  - A new foundation needs to be constructed if the Barn is retained/rebuilt.
  - The wood framed exterior walls of the Barn are in poor condition and have failed in several locations. Walls need to be reconstructed.

### MECHANICAL

- 3 Upgrade the boiler plant from oil to a gas-fired condensing unit to save energy with better equipment efficiencies and achieve an overall operating savings (if gas is locally available).
- 3
- Replace existing thermostats with programmable type.

## ELECTRICAL

- 3
- Provide new lighting, including emergency lighting in the basement.
- 2
- Provide exterior emergency lighting.

## PLUMBING

The water closets should be replaced by low flow fixtures.

# **PROGRAM INFORMATION**

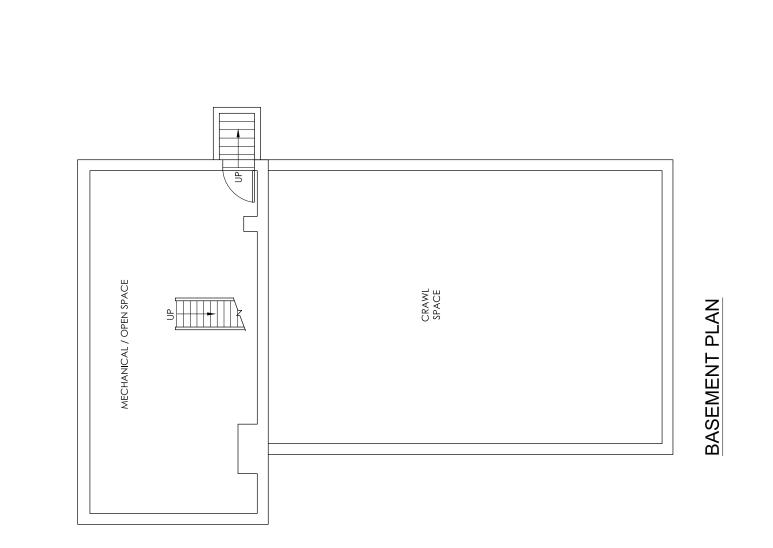

The current building follows the traditional arrangement of New England historic farmhouses often referred to as "Big House, Little House, Back House, Barn". Over the years this has been expanded to create a second floor and to expand the width of the "Little House" portion.

Structurally, the second floor has little carrying capacity and has not been used for occupancy. The first floor will need to be reinforced/replaced to carry the loading for office space use.

The Barn is structurally unsound and needs major repairs to halt further deterioration and possible collapse. The smaller "Back House" is also in poor condition. Low headroom suggests that this portion be removed.

The first option expands the town hall functions around a restored barn and around the existing well. A new accessible entrance will be created, and with a new interior ramp will provide access throughout the first floor of the existing building and addition.

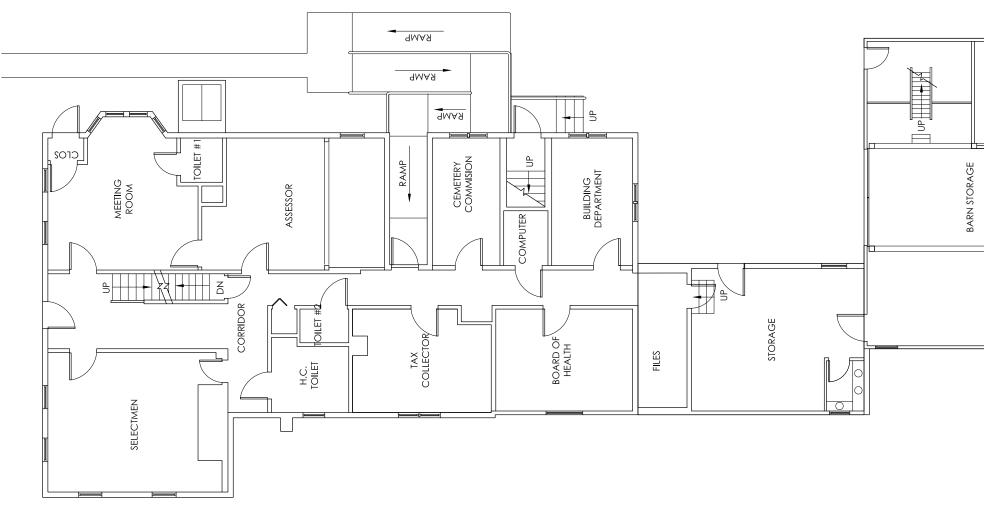

A second option calls for the demolition of the "little house back house and barn" portions and the construction of a two story new wing to the rear of the house. The new wing will provide space for all town offices and the original house would be the museum for historic artifacts and books from the library.

# MUNICIPAL FACILITIES STUDY AND PLANNING Town of Brimfield, Massachusetts

# **Town Office Annex and Barn**

Structural

# Structural Description:

The Brimfield Town Office Annex is a two-story, wood framed structure (plus a partial Basement), located at 23 Main Street, adjacent to the Town Hall. The former Benjamin Salisbury House, constructed in 1819, is listed on the National Register of Historic Places. The facility consists of the original house with a Barn in the back, connected to the house by a one-story link structure.

The Town Office Annex is rectangular in plan, with a sloping roof (intersecting hips). There is a partial

(unoccupied) Basement, located under the front (north) section of the original house. A crawl space was constructed to the south of the Basement. Program elements at the First Floor include Town Offices (Selectmen and various Town Departments), a Meeting Room and Bathrooms. Two additional offices, a Kitchen and storage spaces are located at the Second Floor. The First Floor is accessed by a handicap ramp on the east side of the building. The Second Floor is accessed by front and back stairways; there is no elevator. The Barn and the connecting link are used for storage purposes.

Typical foundation walls are rubble stone. Basement Floor construction in the original house consists of a concrete slab on grade (thickness unknown) in limited areas (dirt floor elsewhere). First Floor construction is wood framed; the arrangement of the framing is somewhat disorganized. Over the east and west sides of the Basement, First Floor joists (8" hand-hewn, spaced at 26"+/- o.c.) span approximately 14 feet in the north-south direction to 8"x7" timber beams. The timber beams span 14+/- feet to similar, north-south timber beams on either side of the central, stair bay. Wood joists in this bay span in the east-west direction, approximately 10 feet. A number of adjustable steel pipe columns have been installed (12+/- total) to shore up the First Floor construction in this area. To the south of the Basement, First Floor construction consists of 1¾" x 6¾" wood joists spaced at 21"+/- o.c., spanning in the north-south direction. Attic Floor construction in the south section consists of 2"x 6½" joists spaced at 22½"+/- o.c., spanning 8+/- feet in the north-south direction and mortised into an 8"x 7%" beam that clear spans the space (approximately 16 feet). Second Floor framing details could not be determined; however, the construction appears to be similar to that at the Attic level.

The southern section of the Second Floor is approximately 8 inches higher (one riser) than the front/northern section. Hip roof construction at the front (north) section of the building consists of  $5''x 4\frac{1}{2}''$  rafters spaced at 32''+/- o.c. spanning to a central, east-west ridge beam and hip members on the east and west sides. Roof framing for the intersecting hip to the south could not be observed, but is expected to be similar. The present roof is asphalt shingles.

The gable roof of the link structure is framed with 4x4 rafters spaced at 2'-0''+/- o.c., spanning in the east-west direction to a ridge nailer. Rafters are tied across the space (approximately 16 feet) by 2x8 ceiling joists. The floor of the link building is a concrete slab on grade (thickness unknown). The roof is asphalt shingles.

The Barn is a timber framed structure with a Loft and a structured First Floor. Roof framing members were exposed to view; however, sizes could not be determined. Loft Floor construction consists of 3"x7" or 3"x4½" joists, spaced at 2'-6"+/- o.c. spanning 10½+/- feet in the east-west direction to 7½"x7½" timber beams. It appears that an original support post may have been removed in the past; the north-south span for this timber beam is approximately 24 feet. First Floor construction is wood framed; sizes/spans and the arrangement of framing were not determined during the site visit. The First Floor of the Barn is approximately 8" (one riser) above the floor of the link structure.

No original construction drawings or previous structural reports for the Annex or the Barn were available.

# Structural Conditions/Issues – Comments and Recommendations:

Structural conditions at the Brimfield Town Office Annex and Barn were observed (to the extent possible) during a brief tour of the facility on May 13, 2013. A number of foundation and framing deficiencies were observed, as noted below.

The front (northern) section of the First Floor in the original house appears to be relatively stiff under foot, as the framing has been shored up with adjustable steel pipe columns in numerous locations (photo right). In the absence of the additional supports, the capacity of this framing would be marginal; the supporting timber beams are particularly undersized. FBRA recommends that First Floor framing over the Basement be thoroughly evaluated and reinforced/permanently re-supported in conjunction with future renovations to the building.

 To the south of the Basement, First Floor joists over the crawl space (1¾"x6 ¾" @ 21" o.c. – photo right) in the original house are inadequate for office use. The floor is flexible under foot. The balance of the First Floor structure (further to the south) is flexible and uneven, suggesting that similar conditions are present throughout. FBRA recommends that First Floor framing over the crawl space be thoroughly evaluated and reinforced as required to increase capacity for the intended use, in conjunction with future renovations to the building. In the

meantime, caution should be exercised in placing heavy loads (file cabinets, equipment, etc.) in these areas.

- Rubble stone foundation walls in the original house have taken on moisture over the years and show signs of deteriation. Mortar has desintegrated and turned into powder in some areas; elswhere, mortar appears to be relatively intact. FBRA recommends that roof and surface drainage be evaluated in conjunction with future renovations to the building. Roof and surface water should be directed away from foundation walls and wall joints should be raked and repointed as required.
- Second Floor framing in the original house is flexible under foot. The floor construction sags considerably; particularly at the back/southern section. Member sizes/spans could not be determined; however framing may be similar to that observed at the Attic space above. The 8"x 7½" beam which spans in the east-west direction (approximately 16 feet) has limited capacity to support live load. FBRA recommends that Second Floor framing be thoroughly evaluated and reinforced as required to increase capacity for the

intended use, in conjunction with future renovations to the building. In the meantime, caution should be exercised in placing heavy loads (file cabinets, equipment, etc.) at this level.

• Hip roof framing over the northern section of the original house is performing satisfactorily; however, it is somewhat undersized with respect to current code requirements.

- Gable roof framing over the link structure is performing satisfactorily and nearly meets current snow load requirements for Brimfield. However, there are potential snow drift areas adjacent to the Barn and the original house (photo right). Review and reinforcing of these areas is recommended, in conjunction with future renovations to the building. In the interim, maintenance personnel should clear drifted snow, should it accumulate during the winter months.
- The condition of the exterior walls in the original house could not be determined; however, the northeast corner of the structure is not plumb. The corner walls tilt inwards to the south and to the west. Further review is recommended, in conjunction with future renovations to the building.
- The handicap ramp on the east side of the original house (photos right) has deteriorated significantly; likely due to moisture and de-icing salts. Repair or replacement is required.
- Wood framing in the original house may typically be protected (to a degree) by the ceiling construction; however, elsewhere it is unprotected. There are no

sprinklers. Fire rating requirements should be reviewed in conjunction with future renovations to the facility.

- As noted above, it appears that a supporting post for the central, north- south Loft Floor beam in the Barn has been removed. In the absence of the column, this beam has little or no live load capacity. FBRA recommends that the beam be temporarily shored, without delay. Loft Floor joists in the western bay (right hand side in photo at right -3"x4½" @ 2'-6" o.c., spanning 10½ +/- feet) have minimal live load capacity and have deflected considerably. FBRA recommends that joists in this bay be temporarily shored and/or that (storage) loading be removed.
- The capacity of the wood framed First Floor in the Barn was not determined; however, the floor is considerably uneven throughout, suggesting that there may be damage and/or deficiencies present.

- Barn roof construction was observed (from a distance) and generally appears to be performing satisfactorily; however, walls and foundations supporting this construction are in poor condition, as noted below.
- The rubble stone foundations of the Barn are in poor condition (photo right) and have failed in some locations (e.g. the southwest corner). It appears that the foundation is beyond repair, FBRA recommends that a new foundation be constructed if the Barn is retained/rebuilt.
- The wood framed exterior walls of the Barn are in poor condition and have failed in several locations. Walls are bowing out at the First Floor and Loft Floor levels on the back (south) and west sides of the structure. Wall construction at the southeast corner has failed. There are a number of areas where wood trim/cornices are rotted and/or missing, allowing water to enter the building.

## **Building Code Requirements and Additional Comments:**

# Massachusetts State Building Code Requirements – General Comments:

Proposed renovations, alterations, repairs and additions to the Brimfield Town Office Annex and Barn would be governed by the provisions of the Massachusetts State Building Code (MSBC – 780 CMR 8<sup>th</sup> Edition) and the Massachusetts Existing Building Code (MEBC). These documents are based on amended versions of the 2009 International Building Code (IBC) and the 2009 International Existing Building Code (IEBC), respectively.

The MEBC allows the Design Team to choose one of three (3) compliance methods. Structurally, the Prescriptive Compliance Method is preferred. Section 101.5.4.0 of the Massachusetts Amendments (Chapter 34) would require that the existing building be investigated in sufficient detail to ascertain the effects of any proposed work (or change in use) in the area under consideration, and the entire building or structure and its foundations, if impacted by the proposed work or change in use.

## Additions – General Comments:

The design and construction of any proposed additions would be conducted in accordance with the Code for new construction. Significant additions should be structurally separated from the existing building by an expansion (seismic) joint to avoid an increase in gravity loads and/or lateral loads to existing structural elements. Smaller additions can be structurally attached to

the existing building, provided they do not increase the demand - capacity ratio of the existing lateral force resisting elements in the building by more than 10%.

# Renovations/Alterations – General Comments:

Where proposed alterations to existing structural elements carrying gravity loads results in a stress increase of over 5%, the affected element would need to be reinforced or replaced to comply with the Code for new construction. Proposed alterations to existing structural elements carrying lateral load (perimeter wood walls and Ground Floor masonry walls) which result in an increase in the demand - capacity ratio of over 10% should be avoided, if possible. Essentially, this means that removal of, or major alterations to these walls should be minimized. If this is not avoidable, more significant seismic upgrades/reinforcing will be required; potentially including the addition of lateral force resisting elements (wood shear walls, etc.).

# Renovations/Alterations – Anticipated Scope of Structural Work:

# **Original House and Link Structure**

As noted above, First and Second Floor construction appears to be inadequate for office use (as well as other potential uses). The preliminary cost estimate should carry allowances for the following structural work.

- Repair/repointing of original rubble stone foundation walls.
- Address roof drainage and surface drainage around the building perimeter.
- Repair/reinforcing/reconstruction of the First and Second Floor framing, including permanent supports/foundations in the Basement.
- Construction of a new slab on grade in the Basement on compacted granular fill and a vapor barrier.
- Reinforcing of the roof structure; particularly for snow drift conditions at the link structure.
- Repair/reconstruction of the handicap ramp on the east side of the facility.
- Installation of a new elevator, if required by code.
- Installation of a sprinkler system, if required by code or desired by the Town.

## <u>Barn</u>

- Based on field observations, it appears that it would be more cost effective to dismantle the Barn and salvage floor and roof framing to be used in a reconstruction effort. Framing deficiencies are pervasive and would be difficult to repair/reinforce in place.
- Once the Barn framing has been dismantled, the existing rubble stone foundation walls should be removed and a new, reinforced concrete foundation should be constructed.

# **End of Structural Report**

TOWN BUILDING ASSESSMENT STUDY AND CAPITAL MASTER PLAN Town of Brimfield, Massachusetts

# Town Hall Annex

23 Main Street

MECHANICAL, ELECTRICAL, PLUMBING, AND FIRE PROTECTION SYSTEMS

Prepared By:

Consulting Engineering Services 510 Chapman Street, Suite 201 Canton, MA 02021

July 3, 2013

# GENERAL

The mechanical, electrical, plumbing, and fire protection systems were reviewed in conformance with the requirements of the following State and National codes and regulations, as applicable:

- Massachusetts State Building Code 8th Edition
- Massachusetts State Fire Prevention Regulations
- NFPA Latest Editions
- Massachusetts Plumbing Code
- Massachusetts Mechanical Code
- Massachusetts Electrical code (NEC 2011 Edition)
- Illuminating Engineering Society of North America (IESNA) Lighting Handbook
- ASHRAE 90.1 Latest Edition

The scope of this study does not include operational assessment of the fixtures and equipment reviewed; it includes only a brief visual review of the fixtures and equipment. Therefore notes regarding the condition of the fixtures and equipment may or may not be indicative of the actual condition of the systems and equipment and/or the expected life of the fixtures and equipment. Therefore it is recommended that services of a qualified technician be retained to evaluate the actual condition of fixtures and equipment prior to replacement.

# MECHANICAL

#### HEATING

The building is served by an oil fired gravity vent hot water boiler located in the basement that is in fair condition. There is a single 275 gallon oil tank in the basement with exterior fill and vent connections piped from the front of the building. The plant consists of (4) zones, each with a dedicated circulator pump, all of which are in good condition. Controls are very basic, wall mounted dial thermostats wired in parallel to a common boiler relay module. The boiler also serves the domestic water heating needs (see Plumbing Section below).

The four heating zones include 3 on the first floor (2 in front, 1 in rear) and the fourth incorporating the entire second floor. Radiation equipment is a combination of steel and cast iron baseboards generally along the perimeter of each room except for a couple of short lengths in the central corridor of the first floor. There is also a small hot water unit heat in the basement that appears to be supplied from one of the first floor zone supply lines.

There are several small lengths of electric baseboard heat in the main corridor on the first floor and at the bottom of the rear stairwell plus a small recessed wall mounted electric cabinet heater in the kitchen on the second floor.

#### AIR CONDITIONING

There is no central air conditioning system in the building. Several window/wall mount units were noted in the storage area and it is assumed they are used in the warmer months for local room conditioning as needed.

#### VENTILATION

There is no mechanical ventilation system in the building but there are operable windows throughout that appear to be of adequate free area to meet the natural ventilation code requirements.

There are ceiling cabinet fan/light combination units in each of the first floor bathrooms and in one of the second floor bathrooms but no exhaust at all in the front bathroom on the second floor. There is also a cabinet style exhaust fan mounted in the wall of the stairs leading to the basement that pulls air from the first floor and blows it into the basement. It is unclear what the purpose of this unit is. The electric range/oven in on the second floor has a local recirculation hood over it as well.

#### RECOMMENDATIONS

Upgrade the boiler plant from oil to a gas-fired condensing unit to save energy with better equipment efficiencies and achieve an overall operating savings (if gas is locally available).

Replace existing thermostats with programmable type.

Provide an exhaust fan to serve the bathroom on the second floor.

# ELECTRICAL

## EXISTING SYSTEMS

This building appears to be served by (3) electrical services evident by the (3) revenue meters located on the outside of the building.

One electric service is located in the basement. This is a 200amp, single phase electric service. There is a meter socket and panelboard that make up the service equipment. This equipment is in fair to poor condition.

There are newer electrical panels located throughout the building. We believe these are part of the other (2) electrical services, although this could not be verified. These panelboards are in good condition.

The exposed wiring in the basement consists of many different types of wiring. Some of this wiring is very old and in poor condition.

The lighting throughout the building consists or recessed or surface mounted fluorescent fixtures. These fixtures are in good condition.

The lighting in the basement is in poor condition and additional fixtures are required for proper lighting for service, etc.

Emergency lighting consists of two-head self-contained battery units. These units are in good condition.

Exit signs are fluorescent units. These signs are in good condition.

#### RECOMMENDATIONS

Provide new lighting, including emergency lighting in the basement.

Provide exterior emergency lighting.

# PLUMBING

#### **EXISTING SYSTEMS**

Cold water is from a well. The pump for the system is in the well, therefore the condition of the pump is not included in this study The compression tank for the system is adjacent to the boiler in the basement, and it appears to be in fair to good condition.

Hot water is provided via a coil in the heating boiler. The hot water discharge from coil is routed through a manually adjustable mixing valve, thereby tempering the water so that it is not too hot at the fixtures.

The exposed water piping in the basement is copper, and it appears to be in fair to good condition. The exposed drain piping in the basement is cast iron, plastic, and copper, and it appears to be in fair to good condition.

The water closet in the main floor restroom is a floor mount vitreous china tank type unit, and it appears to be in good condition. The water closets in the two restrooms upstairs are the floor mount vitreous china tank type units, they are not accessible, and they appear to be in fair to good condition. None of the water closets are low flow.

The lavatory in the main floor restroom is the wall mounted vitreous china type, it is accessible, and it appears to be in good condition. The lavatories in the two restrooms upstairs are the molded into the countertop vitreous china type and they are not accessible. One of the lavatories upstairs appears to be in fair to good condition, whereas the other appears to be in poor to fair condition.

One of the restrooms upstairs has a tub, either vitreous china or enameled steel/cast iron, and it appears to be in fair condition. The shower valve for this tub is not pressure balanced.

The other restroom upstairs has a multiple piece shower surround that appears to be in poor condition. The valve for this shower is not pressure balanced.

The kitchen upstairs has a double bowl stainless steel sink. Both the sink and the faucet appear to be in fair to good condition.

#### RECOMMENDATIONS

The water closets should be replaced by low flow fixtures.

The lavatory upstairs in fair to poor condition should be replaced.

The multiple piece shower surround should be replaced, and both of the shower valves should be replaced by pressure balanced valves.

# **FIRE PROTECTION**

The building does not have a sprinkler system.

#### BUILDING USE AUDIT - CONDITION ASSESSMENT Town of Brimfield, Massachusetts

#### **Brimfield Public Safety Headquarters**

34 Wales Road

Year Constructed:	Unknown
Addition Constructed:	1993
Construction Type:	IIB
Fire Sprinklers:	No
Building Area:	5,647 SF

Documents Used in Study: Assessor Field Card

#### General:

#### The building is not handicapped accessible:

- 3 One (1) exterior and all interior doors are not equipped with lever hardware. Replace all hardware to meet code.
- 4 One toilet room is in general, but not full compliance with ADA and the other does not comply. Make minor modifications to door and clearances so at least one room fully complies.

Doors from Fire Equipment Bays into Day Room and Ambulance Office have door clearance issues. Reconfigure doors and partitions to provide the correct clearance.

2		
		С
		3

Day Room kitchen base cabinet has no knee space and is not ADA compliant. Change base cabinets.

The sink in this base cabinet is not connected to any cold/hot water or to a waste line. The water supply is currently contaminated and bottles water is supplied to the facility. See Plumbing.

Suspended ceiling panels are aged (dull/dirty & sagging) and need to be replaced.

- Replace (3) existing single pane steel windows in the Fire Equipment Bays with new insulated metal windows.
- Install new Vehicle Exhaust Removal System in both the Fire Equipment Bays and Ambulance bays. (8 bays total)
- Replace damaged existing single door between Day Room & Ambulance Bays with new insulated door.
- Install new trench drain and associated piping in existing concrete slab in Fire Equipment Bays and Ambulance Bays. (8 bays total)
- Install new closers on all doors (2 single & 1 double) from the Day Room into Fire / 3 Ambulance Bays.

#### Exterior

2

3

4

3

3

3

- All existing gutters to be cleaned, reattached to fascia with slope to 3 downspout and all joints and end caps sealed to stop water stains and damage to exterior walls.
- Water from downspouts be piped away from the building, to minimize 3 damage to cmu wall, foundation and finish grade. Clean all water stains from walls. Fill in all low spots to create a positive slope away from building.
  - Joint between original building and addition at west end is cracked. Saw cut joint and create expansion joint in wall. (Fire Equipment Bay #8)
  - Minor re-pointing of cmu and brick around entire existing building. (5%)
  - Replace aprons at overhead doors at front of building with concrete aprons with frost walls. Aprons to extend at least 4 feet from building.

- Miscellaneous wood rot / damage and paint peeling 3 at existing Texture 1-11 siding, door / window trim and fascia boards. Patch, prime and re-paint trim. Replace Texture 1-11 with painted cement siding. Replace trim at new siding.
- Portions of trim at overhead doors are deteriorated or missing. Remove 3 damaged sections and patch remainder. Replace missing trim at overhead door jambs. Repaint.
  - Repaint west wall of east Equipment Bays.
- Bricks at corner of east wall are spalling. Replace damaged brick. 2 Saw cut a joint between brick and CMU to create an expansion joint. Add filler, backer rod and sealant to joint.
- Floor at overhead doors in east equipment bays is crack. Cut out damaged portions and 3 replace doweling work into adjacent slabs. (It is suggested that this work be coordinated with the new trench drains and new concrete aprons)
  - Exterior walls are uninsulated at Equipment Bays.
  - Hose Dryer is in need of replacement.

#### **MECHANICAL**

3

3

- Update heating equipment from oil to gas to save energy due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).
- Update to programmable type thermostats for control of the furnaces and/or the 3 electric unit heaters.
- Replace the common area furnace with two units and reconfigure the ductwork to 3 provide better zoning and control. Separate the distribution to the police offices from that of the common area and provide dedicated thermostats for each unit.

- Provide an exhaust fan in the bathroom adjacent to the EMT office.
- Provide direct ducted outdoor air for the furnace serving the fire truck garage with a roof cap intake and damper assembly linked to the furnace operation. Also add a general exhaust fan in this garage to operate during occupied periods in conjunction with the furnace.
- 3 Replace the other garage's electric unit heaters with a warm air furnace and supply air distribution similar to the fire truck garage and provide a direct ducted outdoor air/intake and damper assembly as noted above. Also include a general exhaust fan in this garage to operate in conjunction with the new furnace.

#### ELECTRICAL

- 3 The manual transfer switch should be replaced with an automatic transfer switch and controls.
- 2 New LED exit signs with integral batteries should be provided to replace the existing.
- 2 The exterior lighting should be replaced with a high-efficiency LED type fixture to improve the lighting levels and reduce energy costs.
- 2 A fire alarm system should also be added to the facility.

#### PLUMBING

- If it is determined that filtration and/or treatment could make the well water potable, a filtration and/or treatment system should be provided such that the well water is potable. As it is likely that the filtration/treatment system will reduce the water pressure to an unacceptable level, the well pump should be replaced by a higher head well pump.
- 2 Once the well water is made potable, a new faucet should be provided at the sink and it should be (re)connected to the water system.
- The electric water heater should be replaced in the near future. The new water heater should be provided with a mixing valve, such that 140°F can be maintained in the tank without the possibility of scalding at the fixtures.

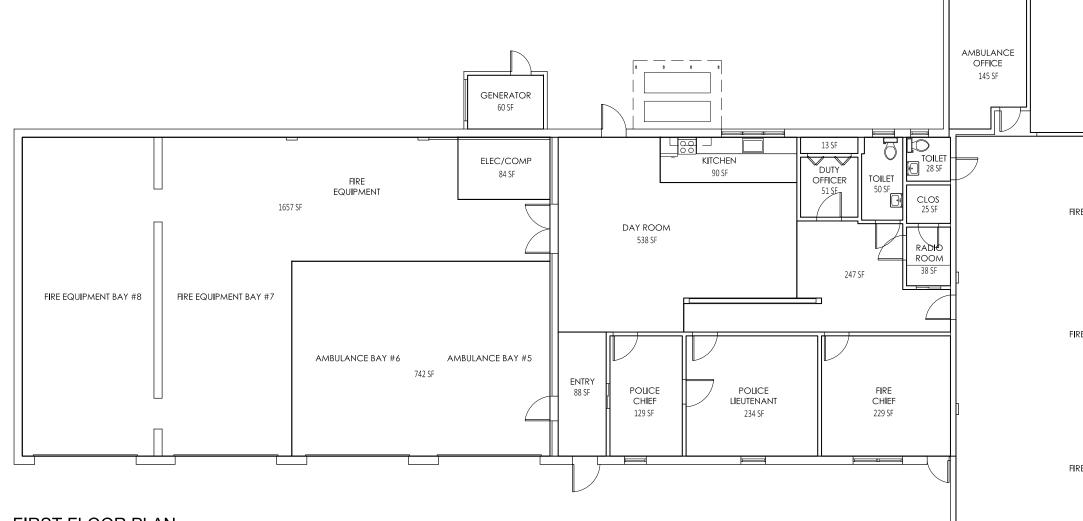

Both of the water closets should be replaced with low flow fixtures.

#### **PROGRAM INFORMATION**

The building currently serves the Fire and Police departments, and Ambulance service. Workspaces are inadequate and do not meet the needs of the departments. The police were formally housed in Town Hall up until they were moved out due to structural issues with that building. If the police were moved out of this building, either to a new building or back to a renovated Town Hall the current Public Safety Building, with an addition, will be able to meet the needs of the Fire Department and Ambulance service. An addition is necessary to provide bunk rooms and the associated shower and locker rooms for the FD.

Equipment bays are very tight in area and height due to the configuration of the building. It is recommended that the roof of the two west bays be reconstructed to a higher elevation and two new overhead doors be provided on the north and south sides of these bays. With a new driveway along the north side of the building the larger pieces of FD equipment would have drive through bays. Smaller equipment would then be housed in the east end. Ambulance bays will remain in their current locations.

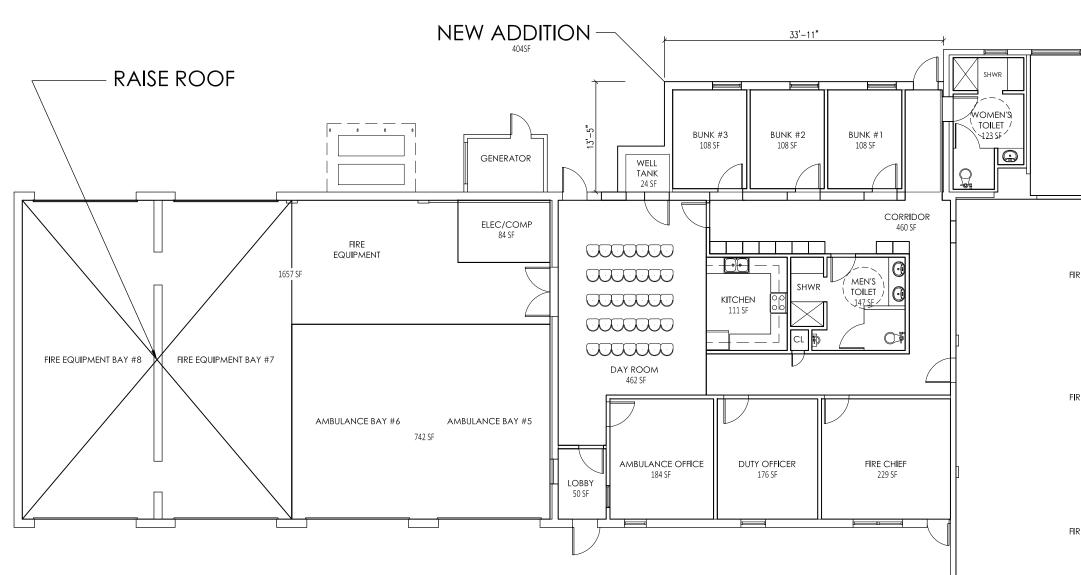

Refer to Public Safety Space Needs and associated Test Fit plans.

#### MUNICIPAL FACILITIES STUDY AND PLANNING Town of Brimfield, Massachusetts

#### **Public Safety Headquarters**

Structural

#### Structural Description:

The Public Safety Headquarters is a one-story, steel framed structure, located at 34A Wales Road in Brimfield. The construction date of the building is unknown; however, it appears to be 1970's vintage. The facility is "T" shaped in plan, approximately 150 feet long (east-west) and 70 feet/40 feet wide (front and back sections, respectively). A single Fire Truck

bay was added to the north side of the front section sometime after the original construction, increasing the number of Fire Truck bays from three (3) to four (4) in this section.

Offices, a Break Room, Storage spaces and Bathrooms are located behind the front, Fire Truck bays. There are four (4) additional vehicular bays at the western end of the facility, including two Ambulance bays. Roof construction is flat (pitched to drain); the roof of the front section (Fire Truck bays) is several feet higher than that of the western section.

Typical foundation construction is assumed to be conventional spread footings, with a concrete slab on grade First (Ground) Floor. Roof construction over the (higher) front section consists of 1½" deep, narrow rib steel roof deck spanning to 12" deep, open web steel joists. The joists are spaced at 6+/- feet on centers and span approximately 17 feet in the north-south direction to steel beams. Steel beams (W16+W10 composite sections) clear span the bay in the east-west direction, approximately 38 feet. Roof construction over the added bay in this section consists of 1½" deep, wide rib, galvanized steel roof deck spanning to W12 steel beams. The steel beams are spaced at 6+/- feet on centers and span approximately 18 feet in the north-south direction to masonry bearing walls at each end. The roof of the western (Office and Ambulance bay) section is also steel framed, consisting of  $1\frac{1}{2}$ " deep, narrow rib steel roof deck spanning to 12" deep, open web steel joists. The joists are spaced at 6+/- feet on centers and span approximately 16 feet in the east-west direction to steel beams. Steel beams (W12's, spanning 20+/- feet) are continuous over a an interior W6 column and are supported at the north and south ends by masonry exterior wall construction. Exterior walls are typically solid brick and block construction; 12" thick (8" CMU plus 4" brick veneer). Lateral stability (wind and seismic loads) is provided by interior and perimeter masonry walls (presumably unreinforced) in each direction.

No original construction drawings or previous structural reports were available.

#### Structural Conditions/Issues – Comments and Recommendations:

Structural conditions at the Public Safety Headquarters were observed during a brief tour of the facility on May 13, 2013. A significant portion of the roof and wall construction was exposed to view, except in the Office area. Ceiling tiles in the Office area were removed, to allow an examination of the roof structure above. Generally speaking, roof construction appears to be performing satisfactorily; there is no evidence of structural distress that would indicate significantly overstressed, deteriorated or failed structural members. Foundations appear to be performing adequately; there are no signs of significant, total or differential settlements. The concrete slab on grade appears to be in satisfactory condition; however, exterior approach slabs at vehicular bays have suffered damage from freeze/thaw action and/or de-icing salts.

Structural/structurally related conditions observed during site visit are noted below:

- The condition of the exterior brick veneer is generally satisfactory; however some cracking was observed and repair/repointing is required in certain locations.
- The capacity of the roof framing was not determined (steel joists are a proprietary design); however, roof framing appears to be functioning as originally intended. One area of potential concern is at the junction of the high and low roofs; it does not appear that snow drift loading was accounted for in the original design.

• Steel roof framing is unprotected and has no fire resistance rating. There are no sprinklers. Fire rating requirements should be reviewed in conjunction with future renovations to the facility.

#### **Building Code Requirements and Additional Comments:**

Proposed renovations, alterations, repairs and additions to the Brimfield Public Safety Headquarters would be governed by the provisions of the Massachusetts State Building Code (MSBC – 780 CMR 8<sup>th</sup> Edition) and the Massachusetts Existing Building Code (MEBC). These documents are based on amended versions of the 2009 International Building Code (IBC) and the 2009 International Existing Building Code (IEBC), respectively.

The MEBC allows the Design Team to choose one of three (3) compliance methods. Structurally, the Prescriptive Compliance Method is preferred. Regardless of the compliance method chosen, the MEBC may require that the (presumably unreinforced) masonry walls of the building be evaluated with respect to the provisions of Appendix A1 of the IEBC (depending on the extent of the renovation/alteration work and/or proposed change(s) in use). In addition, Section 101.5.4.0 of the Massachusetts Amendments (Chapter 34) requires that the existing building be investigated in sufficient detail to ascertain the effects of the proposed work (or change in use) on the area under consideration, and the entire building or structure and its foundations, if impacted by the proposed work or change in use.

#### Additions – General Comments:

The design and construction of proposed additions would be conducted in accordance with the Code for new construction. Significant additions should be structurally separated from the existing building by an expansion (seismic) joint to avoid an increase in gravity loads and/or lateral loads to existing structural elements. Smaller additions can be structurally attached to the existing building, provided they do not increase the demand - capacity ratio of the existing lateral force resisting elements in the building by more than 10%. Presently, no additions to this building are proposed.

#### Renovations/Alterations – General Comments:

Where proposed alterations to existing structural elements carrying gravity loads results in a stress increase of over 5%, the affected element will need to be reinforced or replaced to comply with the Code for new construction. Proposed alterations to existing structural elements carrying lateral load (masonry walls in this case) which result in an increase in the demand - capacity ratio of over 10% should be avoided, if possible. Essentially, this means that removal of, or major alterations to the existing, (presumably unreinforced) masonry walls in the building should be minimized. If this is not avoidable, more significant seismic upgrades or reinforcing will be required; potentially including the addition of lateral force resisting elements (braces, shear walls, etc.).

#### Proposed Alterations and Renovations - Anticipated Scope of Structural Work:

Proposed alterations to the building include raising the height of the roof over the westernmost, two (2) vehicular bays in the building and creating two, higher drive-through Fire Truck bays with roll up doors at the north and south ends. The anticipated scope of structural work would include the following:

- Construct a temporary, wood framed wall at the eastern edge of the work area to protect the remaining portion of the building from weather and construction activities.
- Demolish and remove the existing roof structure in the subject bays, taking necessary precautions not to damage the existing, remaining structure to the east. An option may include salvaging the existing, open web steel roof joists to be used in the construction of the new (higher) roof.
- Provide temporary bracing to keep the structure safe and aligned at all times.

- Demolish and remove the existing masonry walls in the subject bays; including the north, south west and interior (north-south) walls. The existing masonry walls are presumably unreinforced and do not meet current building code requirements. Accordingly, the vertical extension of these walls to support the new, higher roof construction would not be permissible by code.
- Construct new, reinforced masonry bearing walls (8" CMU with a 4" brick veneer) to support the higher roof. The new walls will rest on the existing foundation (with drilledin dowels) and be reinforced/grouted. Openings for overhead doors will be provided on the north and south sides. On the east side of the new, higher roof, provide a steel column extension above the existing, interior column. The vertical wall defining the step in the roof elevation should be lightweight construction; steel studs and panels.
- Construct a new, steel framed roof at the higher level, with 1½" deep, 20 gauge, Type WR galvanized steel roof deck, open web steel joists (new or salvaged), supported on new, reinforced masonry bearing walls (or new steel beams in the alternate approach). The estimated total weight of structural steel (steel beams, columns and joists) is approximately 9.0 psf.

MECHANICAL, ELECTRICAL, PLUMBING, AND FIRE PROTECTION SYSTEMS

Prepared By:

Consulting Engineering Services 510 Chapman Street, Suite 201 Canton, MA 02021

June 26, 2013

#### GENERAL

The mechanical, electrical, plumbing, and fire protection systems were reviewed in conformance with the requirements of the following State and National codes and regulations, as applicable:

- Massachusetts State Building Code 8th Edition
- Massachusetts State Fire Prevention Regulations
- NFPA Latest Editions
- Massachusetts Plumbing Code
- Massachusetts Mechanical Code
- Massachusetts Electrical code (NEC 2011 Edition)
- Illuminating Engineering Society of North America (IESNA) Lighting Handbook
- ASHRAE 90.1 Latest Edition

The scope of this study does not include operational assessment of the fixtures and equipment reviewed; it includes only a brief visual review of the fixtures and equipment. Therefore notes regarding the condition of the fixtures and equipment may or may not be indicative of the actual condition of the systems and equipment and/or the expected life of the fixtures and equipment. Therefore it is recommended that services of a qualified technician be retained to evaluate the actual condition of fixtures and equipment prior to replacement.

# MECHANICAL

### HEATING

An oil fired, gravity vent, hot air furnace hung horizontally near the ceiling within the main fire truck garage serves this area. Supply air distribution is routed to registers generally located to blow towards each overhead door. This unit is controlled from a local dial type thermostat in the garage. This unit has no direct ducted outdoor air and is vented directly through the roof above the unit. The unit was recently replaced and is in excellent condition.

Another oil fired, gravity vent, hot air furnace hung horizontally above the accessible ceiling in the station common room serves this area and adjacent offices, including the police offices. There is a dial type thermostat controlling this unit in the common area. This unit has no direct ducted outdoor air and is vented directly through the roof above the unit. The unit is in fair condition. Both furnaces are fueled from a pair of 330 gallon oil tanks mounted exterior to the rear of the building under an awning.

The garage area on the opposite end of the building from the fire truck garage includes (3) horizontal style electric unit heaters hung from the ceiling near each of the overhead doors blowing into the garage. Each is controlled by a unit mounted dial thermostat.

The EMT's office adjacent to the fire truck garage includes a length of electric baseboard heat with an integral dial thermostat.

### AIR CONDITIONING

There are two separate ductless split systems in the building. A 2-ton wall mounted unit serves the common room between the offices with the outdoor unit on grade just outside the rear door. A 1.5-ton wall mounted unit serves the police office with this outdoor unit mounted on a wall stand projecting from the front of the building. Both units have remote controller operating devices and are in good condition.

### VENTILATION

There is a ceiling cabinet exhaust fan in the bathroom adjacent to the common space.

The fire truck garage includes (3) ceiling paddle fans for general air circulation that are locally switched on or off.

There is no form of fume or general exhaust in either of the garages.

### RECOMMENDATIONS

Update heating equipment from oil to gas to save energy due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).

Update to programmable type thermostats for control of the furnaces and/or the electric unit heaters.

Replace the common area furnace with two units and reconfigure the ductwork to provide better zoning and control. Separate the distribution to the police offices from that of the common area and provide dedicated thermostats for each unit.

Provide an exhaust fan in the bathroom adjacent to the EMT office.

Provide direct ducted outdoor air for the furnace serving the fire truck garage with a roof cap intake and damper assembly linked to the furnace operation. Also add a general exhaust fan in this garage to operate during occupied periods in conjunction with the furnace.

Replace the other garage's electric unit heaters with a warm air furnace and supply air distribution similar to the fire truck garage and provide a direct ducted outdoor air/intake and damper assembly as noted above. Also include a general exhaust fan in this garage to operate in conjunction with the new furnace.

# ELECTRICAL

## EXISTING SYSTEMS

The building is served by a single 200 amp electric service and panelboard located in the rear of the apparatus bay. The service equipment is in good condition. There is also a 150amp electrical panel labeled "Emergency" that is fed by the manual transfer switch and generator.

The building also has a 100amp manual transfer switch to which a generator is attached in the event of a power outage. An existing 15kW, 240/120volt diesel fired generator is located in a small addition at the rear of the building. This equipment is in good condition.

The lighting consists of 8' industrial fluorescent fixtures with T8 lamps in the vehicle bays and 2x4 recessed acrylic lensed fixtures in office and other areas. The lighting in the maintenance bays and other areas is adequate.

The exit signs are fluorescent type without batteries. These fixtures are in fair condition.

The exterior lighting consists of wall mounted high pressure sodium fixtures controlled by a time clock. These fixtures are in fair condition.

### RECOMMENDATIONS

The manual transfer switch should be replaced with an automatic transfer switch and controls.

New LED exit signs with integral batteries should be provided to replace the existing.

The exterior lighting should be replaced with a high-efficiency LED type fixture to improve the lighting levels and reduce energy costs.

A fire alarm system should also be added to the facility.

## PLUMBING

Water is provided by a well pump which serves both the Police and Fire Building and the DPW Building. The expansion tank for the pump and the controls for the pump are in the Police and Fire Building, and they appear to be in fair condition. The pump is in the well, and therefore it's condition is not included in this review.

There is a stainless steel kitchen sink in the meeting/open area, but it does not have a faucet. It appears to be in good condition. Per the staff, the water from the well is not potable, therefore the absence of a faucet.

As the water is not potable, the well water should be tested to check whether or not, with the right filtration/treatment, it would be acceptable for drinking. If so, the appropriate filtration/treatment systems should be provided. Where the filtration/treatment system would create an unacceptable pressure drop on the system, the well pump should be replaced with a larger well pump.

There are no floor drains in any of the apparatus bays.

There is an air compressor in apparatus bay area towards the West. It appears to be in good condition. There is no permanent compressed air piping system in the building; hoses only are connected to the compressor.

A tank type electric water heater in the Police and Fire Building provides hot water for the lavatories. There is no mixing valve provided with the water heater. The water heater appears to be in poor to fair condition, but it also appears to be relatively old, and electric water heaters tend to have relatively short lives, therefore the water heater should be replaced in the near future.

There is an accessible restroom, and both the lavatory and the water closet appear to be in good condition. The water closet is a floor mount vitreous china tank type fixture, and the lavatory is a wall mount vitreous china fixture. The water closet is not a low flow fixture. There also is a non-accessible restroom, and both the lavatory and the water closet appear to be in fair condition. The water closet is a floor mount vitreous china tank type fixture, and the lavatory is a wall mount vitreous china fixture. The water closet is not a low flow fixture.

# **FIRE PROTECTION**

The building does not have a sprinkler system.

# BUILDING USE AUDIT - CONDITION ASSESSMENT Town of Brimfield, Massachusetts

# **Brimfield Public Library**

25 Main Street

Year Constructed:	1903	
Construction Type:	IIIB	
Fire Sprinklers:	No	
Building Area per Flo	or:	
	Basement:	806 SF
	First Floor:	2404 SF
	Total Area:	3210 SF

# General:

3

The current building is limited in use due to the rear wing being at a lower floor elevation. The original building is cramped while the rear wing is lightly used as a historic museum space.

# The building is not handicapped accessible:

- 3 Entrance door is located in a thick wall and equipped with a closer. There is insufficient clearance at the side of the door, both interior and exterior. At the exterior of the entrance door, the door is recessed 12 inches and the wall is angled on the required side clearance on the door. Add a push button operator to the door.
- 3 Original entrance doors have a step on the exterior side and a 1" high threshold on the interior. Exterior risers are not equal heights. Code requires that all public entrances be handicapped accessible. This requirement may have been waived due to the historic nature of the building.
  - Cracks in ceiling in multiple areas. Verify plaster is secure and patch cracks. Repaint ceilings.
- 3 Although the only building door at grade, the exterior door to the Sherman Memorial Room is not provided with an access sidewalk so that it could be used by persons with disabilities. Provide a sidewalk around building to connect to parking area.\*

Page 2

- Handrails are too low on stairs from Memorial Room to Main Library. Replace handrails and provide with extensions.
  - Kitchenette is not accessible. Construct new accessible kitchenette.
- 3 Toilet room is not ADA Accessible. Insufficient floor area, no grab bars, and non-compliant plumbing fixtures. Door is only 32" wide, hardware non-compliant and inadequate area on pull side of door. Provide both men's and women's accessible restrooms.
  - Cracks and bubbling in vinyl tile near door from addition to existing build and at rear door. Replace damaged tiles.
  - Door from original building to addition is located in a thick wall and does not meet the required push or pull areas on either side of door. Remove door.
  - Sash cords at window in Children's room replacement.

- 2 Stairs down to basement are narrow, 8" rise at each tread and no hand rails. Center railing is loose and low. Basement is damp and not used for library storage. Leave stair and re-secure railing.
  - Circulation desk is not ADA compliant. Construct new compliant circulation desk.
- Signage within building is not ADA compliant. Replace signage.
  - Furniture does not provide maneuvering clearance for wheelchairs. Reorganize furniture.

3

3

2

3

3

3

- Water from downspouts be piped away from the building, to minimize the 3 potential for water infiltration at the Ground Floor level and to reduce hydrostatic pressure on the foundation walls.
  - Wood rot and paint peeling apparent at trim, soffit and fascia boards. Repair or replace rotted items and re-paint.
  - Cracks are present in mortar joints. Re-pointing stone facade around entire existing structure. (Allow 5% of wall area)
  - Asphalt shingles on addition appear to be aged and are in need of replacement.
- Gutter has fallen off and is damaged on the both the existing structure and 2 the addition. Pieces on ground need to be reinstalled and gutters and down spouts repaired.
- Stucco at rear of addition is pulling away from lath and cracking and bubbling. Around rear door at corner beads stucco is cracking and falling out of Jambs. Stucco at grade on all 3 sides appears to have water damage from down spouts and gutters needing repairs. Remove damaged areas of stucco and replace incorporating expansion joints to reduce future cracking and de-

lamination.

- Frame around Bulkhead doors made of painted Plywood that is peeling and 3 appears to have water damage. Replace bulkhead doors with more secure painted metal unit.
  - Slate tile on roof of existing building needs minor repairs.

# Electrical

3

2

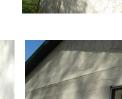

2

3

3

- If air conditioning is added to the building, the electrical service should be upgraded at the same time.
- Review the fire alarm system coverage and upgrade the system to include ADA compliant speaker/strobes.

4 Remove the lighting in the basement and replace with new.

# Mechanical

- 3 The hot air furnace is in poor condition and needs to be replaced.
- The hot water boiler is in poor condition and needs to be replaced.
- Provide air conditioning in the Sherman Memorial Room.
- 3 Ventilation of the building is done using operable windows. There are no mechanical means of ventilation within the building, however, in the original portion of the building there is a grille located at the very peak of the ceiling which might have been used as some form of natural ventilation at one time. Provide mechanical ventilation for the library.

## Plumbing

- <sup>3</sup> Provide localized point-of use electric water heaters to reduce the use of oil for hot water heating.
- 4 Upgrade the plumbing fixtures to meet ADA requirements and current code requirements for low water consuming fixtures.

# **PROGRAM INFORMATION**

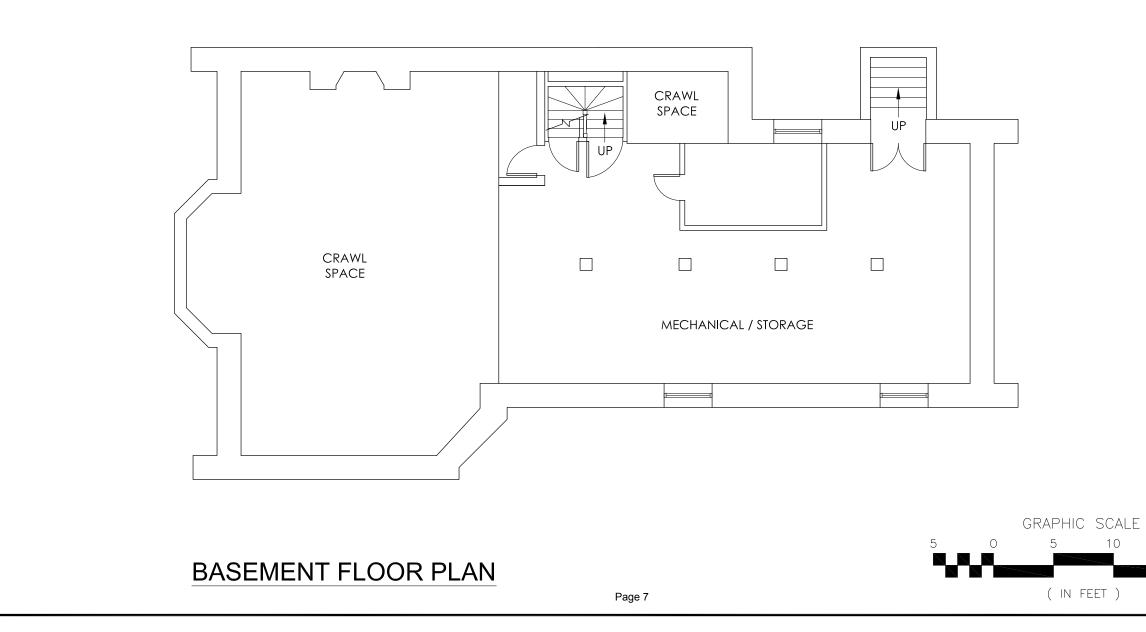

The current library is severely overcrowded with insufficient and undefined space for any of the functions. Cramped adult areas overlap with cramped children's area. There is no children's program space. Staff areas are grossly inadequate and have no workroom or office space. In contrast the addition to the rear of the original building has space and is used almost exclusively for the historic collection. This area is lightly used as it is separated from the main areas of the library by a doorway and stairs.

This is a lovely historic building and in planning any addition it will be necessary to minimize the impact of the new construction. It is also strongly desirable to have the library on one level for handicapped accessibility and easy of movement of materials. There appears to be sufficient headroom to raise the level of the floor in the existing rear addition to accomplish this.

As the building is contiguous with the Town Hall Annex we believe that the set back requirements between the two buildings can be removed as it is effectively one parcel, thus allowing an expansion in that direction.

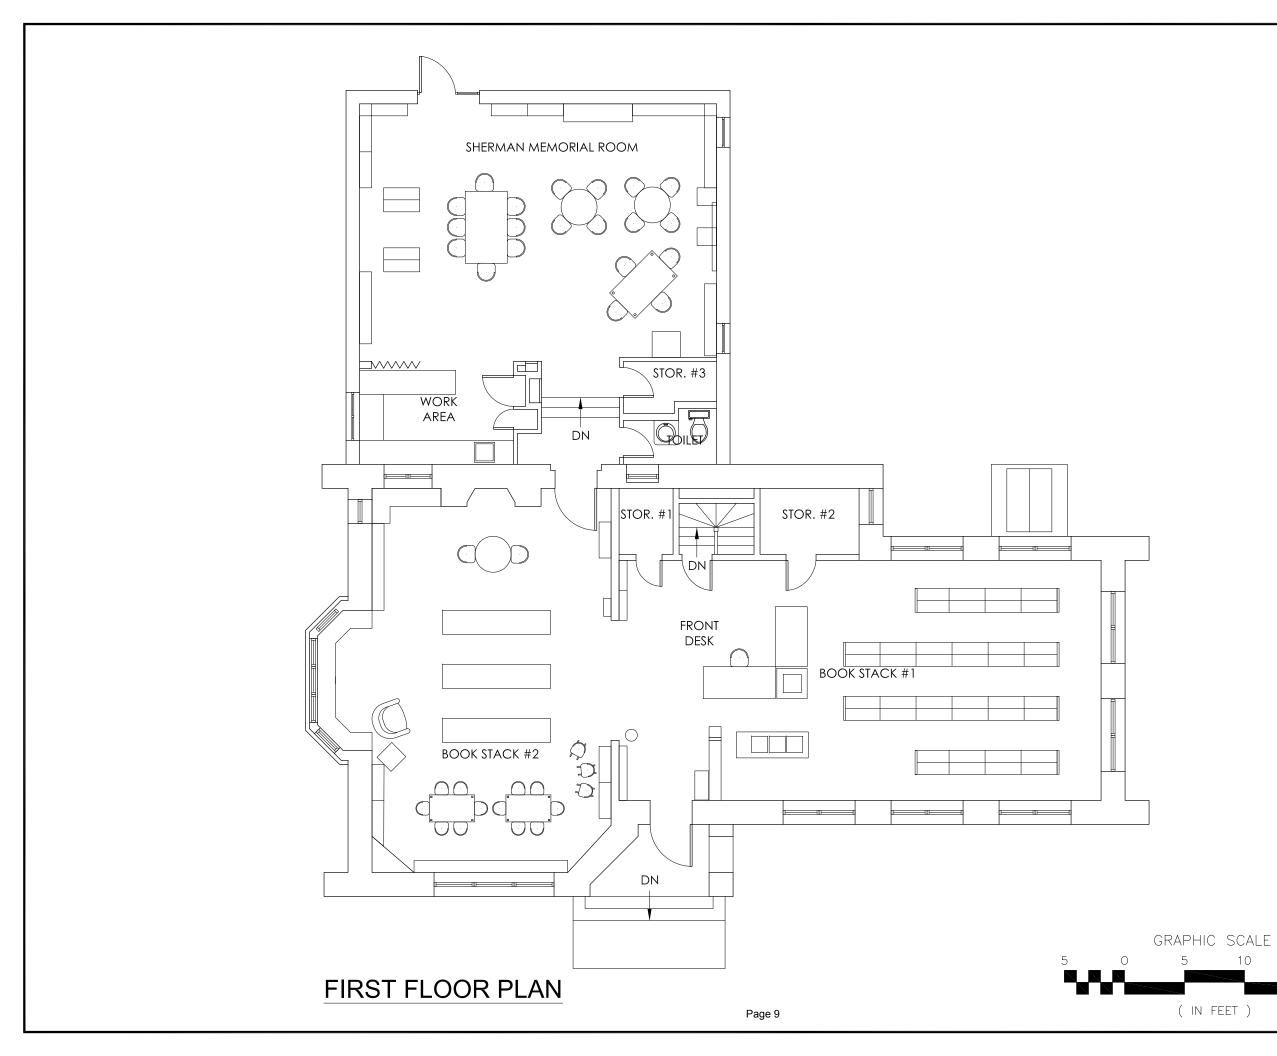

Existing parking and access to the building are not handicapped accessible. It is recommended that space be provided in the Annex parking lot an a new walk created around the front of the Annex to the new library entrance. A walk should also be provided to the current parking.

A Library Space Needs chart is provided together with a Test Fit floor plan for the suggested expansion.

Structural

## Structural Description:

The Danielson-Lincoln Memorial Library is a one-story (plus partial Basement), wood framed structure, located at 25 Main Street in Brimfield. The building was constructed in 1903 and is listed on the National Register of Historic Places.

The Library is L-shaped in plan (including the Sherman

Memorial Room, that was added to the south/back of the original building). Functions at the First Floor include the Front Desk and Collections in the original building; a Work Room and a Bathroom separate this area from the Sherman Memorial Room. The Basement (western two-thirds of the original building) is not used for Library services. Access to the Basement is gained by an internal stair; there is also a bulkhead on the south side of the western wing. The (slate) roof of the original building consists of two intersecting gables; a low pitch gable roof was also constructed over the Sherman Memorial Room.

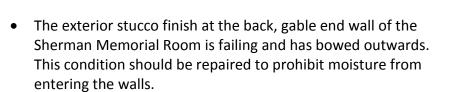

Typical foundation walls are rubble stone. Basement Floor construction is a concrete slab on grade (thickness unknown). First Floor construction in the original building is wood framed, with 2" (nominal) wood joists supported by timber beams. Floor construction in the Sherman Memorial Room is a concrete slab on grade (thickness unknown); this floor is approximately two feet lower than the main floor level. Roof construction is also wood framed; the details of this construction were not determined at the site. Exterior walls are solid stone construction, except the upper gable ends of the main (north-south) gable over the entry are stucco finish.

No original construction drawings for the building or previous structural reports were available.

## Structural Conditions/Issues – Comments and Recommendations:

Structural conditions at the Danielson-Lincoln Memorial Library (building exterior) were observed during a brief visit to the site on May 13, 2013. Generally speaking, the wood-framed structure appears to be performing satisfactorily; there is no evidence of structural distress that would indicate significantly overstressed, deteriorated or failed structural members. Foundations appear to be performing adequately; there are no signs of significant, total or differential settlements. Structural/structurally related conditions observed during site visit are noted below:

- The condition of the exterior stone walls appears to be generally satisfactory. Masonry joints appear to be in satisfactory condition as well.
- The capacity of the First Floor framing was not determined; however, the use of the building has not changed since the original construction, and there are no reports of any structurally related issues.
- The capacity of the roof framing was not determined; however, roof framing appears to be functioning as originally intended.
- There are damaged/missing areas of roof trim at a number of locations around the building. Downspouts are disconnected and some downspouts do not properly direct water away from the foundation walls. If not repaired, these conditions will continue to allow moisture into the building and allow water to build up behind foundation walls.

• Wood framing may typically be protected (to a degree) by the ceiling construction; however, elsewhere it is unprotected. There are no sprinklers. Fire rating requirements should be reviewed in conjunction with future renovations to the facility.

## **Building Code Requirements and Additional Comments:**

### Massachusetts State Building Code Requirements – General Comments:

Proposed renovations, alterations, repairs and additions to the Danielson-Lincoln Memorial Library would be governed by the provisions of the Massachusetts State Building Code (MSBC – 780 CMR 8<sup>th</sup> Edition) and the Massachusetts Existing Building Code (MEBC). These documents are based on amended versions of the 2009 International Building Code (IBC) and the 2009 International Existing Building Code (IEBC), respectively. The MEBC allows the Design Team to choose one of three (3) compliance methods. Structurally, the Prescriptive Compliance Method is preferred. Section 101.5.4.0 of the Massachusetts Amendments (Chapter 34) would require that the existing building be investigated in sufficient detail to ascertain the effects of any proposed work (or change in use) in the area under consideration, and the entire building or structure and its foundations, if impacted by the proposed work or change in use.

## Additions – General Comments:

The Library is currently in need of additional space. The design and construction of any proposed addition(s) would be conducted in accordance with the Code for new construction. Significant additions should be structurally separated from the existing building by an expansion (seismic) joint to avoid an increase in gravity loads and/or lateral loads to existing structural elements. Smaller additions can be structurally attached to the existing building, provided they do not increase the demand - capacity ratio of the existing lateral force resisting elements in the building by more than 10%.

## Renovations/Alterations – General Comments:

Where proposed alterations to existing structural elements carrying gravity loads results in a stress increase of over 5%, the affected element would need to be reinforced or replaced to comply with the Code for new construction. Proposed alterations to existing structural elements carrying lateral load (e.g. the perimeter walls) which result in an increase in the demand - capacity ratio of over 10% should be avoided, if possible. Essentially, this means that removal of, or major alterations to the exterior walls should be minimized. If this is not possible, more significant seismic upgrades/reinforcing will be required; potentially including the addition of lateral force resisting elements (shear walls, etc.).

25 Main Street

MECHANICAL, ELECTRICAL, PLUMBING, AND FIRE PROTECTION SYSTEMS

Prepared By:

Consulting Engineering Services 510 Chapman Street, Suite 201 Canton, MA 02021

July 3, 2013

## GENERAL

The mechanical, electrical, plumbing, and fire protection systems were reviewed in conformance with the requirements of the following State and National codes and regulations, as applicable:

- Massachusetts State Building Code 8th Edition
- Massachusetts State Fire Prevention Regulations
- NFPA Latest Editions
- Massachusetts Plumbing Code
- Massachusetts Mechanical Code
- Massachusetts Electrical code (NEC 2011 Edition)
- Illuminating Engineering Society of North America (IESNA) Lighting Handbook
- ASHRAE 90.1 Latest Edition

The scope of this study does not include operational assessment of the fixtures and equipment reviewed; it includes only a brief visual review of the fixtures and equipment. Therefore notes regarding the condition of the fixtures and equipment may or may not be indicative of the actual condition of the systems and equipment and/or the expected life of the fixtures and equipment. Therefore it is recommended that services of a qualified technician be retained to evaluate the actual condition of fixtures and equipment prior to replacement.

## MECHANICAL

### HEATING

There are two (2) heating systems within the facility.

One system consists of an oil fired hot air furnace located in the basement of the Library. This system provides heating air to the original portion of the library via decorative grilles located in the floor.

The second system consists of an oil fired hot water boiler located in a small room in the basement of the library. This system provides heating water to the baseboard radiation in the Sherman Memorial Room.

The air system that serves the original portion of the library does include a humidifier. This piece of equipment is badly deteriorated and needs replacement.

The hot air furnace and hot water boiler are in poor condition.

### AIR CONDITIONING

Any air conditioning is provided with window type air conditioners.

### VENTILATION

Ventilation of the building is done using operable windows. There are no mechanical means of ventilation within the building, however, in the original portion of the building there is a grille located at the very peak of the ceiling which might have been used as some form of natural ventilation at one time.

### CONTROLS

Local wall mounted thermostats are located in the main portion of the library and the Sherman Memorial Room to control the heating systems.

### RECOMMENDATIONS

Replace the existing hot air furnace with a new furnace with integral air conditioning.

Replace the oil fired boiler with new.

Provide air conditioning in the Sherman Memorial Room.

Provide mechanical ventilation.

## ELECTRICAL

### EXISTING SYSTEMS

There is a single 200amp, 120/240volt, single phase electric service that serves the building. This consists of a utility company meter socket and meter on the exterior of the building and a 200amp panelboard in the basement. This equipment is in fair to poor condition.

The lighting throughout the library consists of surface or pendant mounted fluorescent fixtures. There are also some recessed downlights in the Sherman Memorial Room. The basement has limited incandescent lighting. The lighting fixtures in the Library and Sherman Memorial Room are in good condition. The lighting in the basement is in poor condition.

There is a combination fire alarm and security system in the building. This consists of smoke and heat detectors, security contacts, fire alarm horns, and a key pad. This system is in fair to good condition.

### RECOMMENDATIONS

If air conditioning is added to the building, the electrical service should be upgraded at the same time.

Review the fire alarm system coverage and upgrade the system to include ADA compliant speaker/strobes.

Remove the lighting in the basement and replace with new

### PLUMBING

### **EXISTING SYSTEMS**

Cold water is from a well. The pump for the system is in the well therefore the condition of the pump is not included in this study. There is an existing well pump in the basement that is no longer in use. Domestic water comes from the well on the campus that serves multiple building. There is no compression tank for the system that was visible which means that the water pressure is controlled via another building.

Hot water is provided via a coil in the hot water boiler. The hot water discharge from coil is routed directly to the fixtures using hot water. There is no manually adjustable mixing valve.

The exposed water piping in the basement is copper, and it appears to be in fair condition. The exposed drain piping in the basement is cast iron and it appears to be in fair to condition.

The water closet in the restroom is a floor mount vitreous china tank type unit and it appears to be in good condition. This is not an ADA compliant or low-flow water closet.

The lavatory in the restroom is the wall mounted vitreous china type, NON ADA complaint, and it appears to be in good condition.

The work area in the Sherman Memorial Room has a single bowl stainless steel sink. Both the sink and the faucet are not ADA compliant and appear to be in fair to good condition.

### RECOMMENDATIONS

Provide localized point-of use electric water heaters to reduce the use of oil for hot water heating.

Upgrade the plumbing fixtures to meet ADA requirements and current code requirements for low water consuming fixtures.

### **FIRE PROTECTION**

The building does not have a sprinkler system.

# BUILDING USE AUDIT - CONDITION ASSESSMENT Town of Brimfield, Massachusetts

# **Brimfield Highway Department**

Wales Road

Year Constructed: Construction Type: Approx. 1995 Although the main building is IIB work to the building has lowered the classification to VB

Fire Sprinklers: Building Area per Floor:

First Floor:	6776 SF
Mezzanine:	747 SF
Total Area:	7523 SF

No

Shed Area per Building:

0	
Shed #1:	2228 SF
<u>Shed #2:</u>	313 SF
Total Area:	2541 SF

Documents Used in Study: Aerial Photographs.

## Main Building:

- 3 Replace all locksets with lever hardware type exceept at the two toilet rooms. Add closer to exterior doors to Entrance Hall and Break Room.
- 4 VCT flooring in the Hall is damaged in several places. In other areas (Office, Toilets & Break Rm.) VCT is not performing well. Remove existing VCT flooring and base, replace with sheet vinyl.
- 3 Door to Toilet #2, both approaches do not meet code. Change door and frame to the opposite swing.

Door to Break Room has insufficient side clearances. Change door and frame to the opposite swing.

- 4 Suspended ceiling panels throughout are aged (dull/dirty & sagging) and need to be replaced.
- 3

Break Room kitchen base cabinet has no knee space and is not ADA compliant. Change base cabinets.

2

The riser/tread ratio and handrail on the wood stair up to the mezzanine do not meet code. Remove stair and build new metal stair.

2 At Mezzanine level the existing wood guardrail does not meet code. Remove and replace with new metal guardrail.

Install new trench drain and associated piping in existing concrete slab in Maintenance
 Bays and Vehicle / Storage Bays.

- A storage container was placed adjacent to the west end of the building and a wood enclosure was constructed over it. Exiting from the storage container requires passing through three adjacent areas before reaching an exit access hallway. Code allows passage through only one adjacent space. Similarly, the direct and second exit from the vehicle bays has been enclosed by the wood structure leaving only one exit for the vehicle and maintenance bays. New exit doors should be added; one on the north side of the vehicle bays and one in the storage area adjacent to the container.
  - The storage container is not a permanent solution to the needs of the facility and should be replaces with a metal building addition. The addition needs to accommodate the storage needs plus space for items of equipment that cannot be currently stored in the building. It should also include a wash bay for vehicles with a water recycling system. See program information below.

## Structural

The building is in general good condition. Refer to Structural Report.

### Mechanical

- Update heating equipment from oil to gas, saving energy due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).
- 4

Update to programmable type thermostats for control of the furnaces.

4

Central air conditioning could easily be added for the furnace serving the office areas since the majority of the ductwork is accessible for installation of insulation. Add an evaporator coil on the discharge side of the furnace and provide a split system condensing unit outside the mechanical room piped to the coil. Further, provide a

means for outdoor air to this unit by ducting air from a small sidewall intake louver to the return side of the furnace. Provide a motorized damper on this outdoor air intake that opens upon activation of the fan.

2

There is no exhaust collection system. Add system to the maintenance bays (1st priority) and to the vehicle bays (2nd priority) or provide the following:

- 2 Depending on the usage of the vehicle fume exhaust system when the doors are closed it may be prudent to add a toxic gas detection system for the garage area to alert occupants upon a rise in CO and NO2 emissions which can be life threatening when breathed in by humans at certain concentrations. This type of system can be as simple as
  - sounding an alarm or as complex as
  - energizing ventilation equipment to deplete levels upon detection.

### Plumbing

The water closet in the accessible bathroom at the front entrance should be replaced by a low flow fixture.

The existing water heater should be provided with a mixing valve, such that 140°F can be maintained in the tank without the possibility of scalding at the fixtures.

### Electrical

2

- 2 The manual transfer switch should be replaced with an automatic transfer switch and fixed generator. The use of a portable generator presents a safety concern with the dispensing of fuel, etc.
- 2 New LED exit signs with integral batteries should be provided to replace the existing.
- The exterior lighting should be replaced with a high-efficiency LED type fixture to improve the lighting levels and reduce energy costs.

### Shed #1

2 Salt and sand mixture is not fully contained within the building as a significant gap exists between the walls of the facility and the asphalt paving inside the facility. Overtime this will (or has) caused salt to leach into the ground. For the interior it is recommended that a continuous steel angle be bolted to the horizontal wood boards and columns, and painted with bituminous paint, and sealed to the paving. The angle should be a minimum 7"x4"x3/8" with the long leg vertical.

- Exterior siding has deteriorated where it connects to the ground. Bottom of siding should be removed to a consistent height around the entire building (approx. 1'-0"). Metal flashing to be install at bottom of existing siding, and new horizontal pressure treated siding installed to grade.
- 2 Diagonal wall braces are generally in good condition but two members need to be replaced.

2 Metal roof is in poor condition and needs to be replaced.

### Shed #2

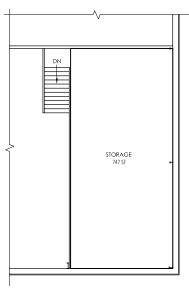

Building appears to be in good condition. No work is suggested at this time.

## **PROGRAM INFORMATION:**

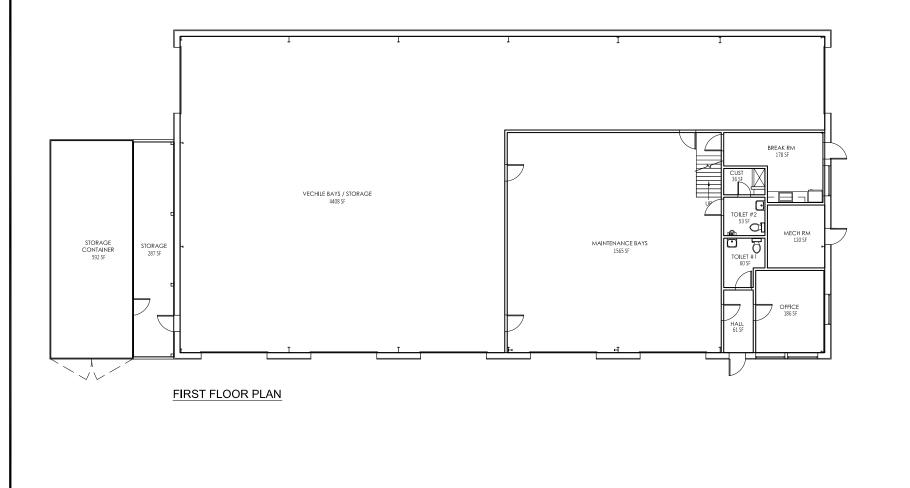

### **Main Building**

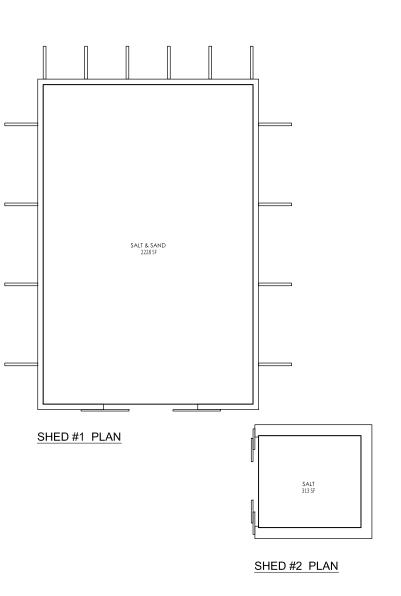

An expansion of the facility is recommended to provide permanent storage (in lieu of the storage container) and to provide a vehicle wash bay with a re-circulating wash system.

The expansion should be constructed to match the existing construction type of the building.

# MUNICIPAL FACILITIES STUDY AND PLANNING Town of Brimfield, Massachusetts

# **Highway Garage**

Structural

## Structural Description:

The Brimfield Highway Garage is a one-story pre-engineered, steel framed structure, located at 34B Wales Road in Brimfield. The construction date of the building is unknown; however, it appears to be 1970's vintage.

The Highway Garage is rectangular in plan, approximately 120 feet long (east-west) and 60 feet wide (north-south). There is a small

(attached) shed structure on the west end of the building. In addition, there are two, separate Storage Sheds on the grounds, located to the east of the Garage. The larger Shed (No. 1) is used for sand and salt storage and the smaller (newer) Shed (No. 2) is used for salt storage only.

Offices are located at the east end of the Garage; a wood framed Storage Mezzanine was constructed over the Offices as well. There five (5) overhead doors to the west of the Offices, located along the south side of the building. There is an additional overhead door at the northeast corner of the building, behind the Offices. The roof is relatively flat, pitching downwards to the back/north side of the building for drainage.

Typical foundation construction is assumed to be conventional spread footings, with a concrete slab on grade First (Ground) Floor. Foundation walls (12" thick) extend approximately four feet above the floor on the north, east and west sides of the building. Roof construction consists of 9½" deep, galvanized steel "zee" purlins spaced at 5+/- feet on centers, spanning approximately 20 feet to steel frames. Steel frames clear span the space (approximately 60 feet) and pitch downwards to the back for drainage, as noted above. A metal roof with "bag" insulation spans between the zee purlins. The east and west end walls of the building are framed with a continuous steel edge/rake beam, supported by steel columns (4 equally spaced, approximately 20 feet on centers). Lateral stability (wind and seismic loads) in the north-south direction is provided by the rigid steel frames, spaced every 20+/- feet. In the east-west direction, lateral stability is provided by a single, 20+/- feet long rigid steel frame (located in the same structural bay as the braced frame on the opposite wall) on the front/south wall. These two, east- west lateral force resisting elements are enjoined by "X" bracing in the plane of the roof . Exterior wall construction is insulated metal panels, spanning vertically to 9½" deep, galvanized steel

"zee" girts, which span horizontally (20+/- feet) to the steel frames. There are two lines of girts between the top of the foundation wall and the eave, resulting in three (3), approximately equal wall panel spans. Full height, light gauge jamb studs have been provided at overhead door locations.

Shed No. 1 is a one-story, wood framed storage structure with a gable roof. The building is rectangular in plan; approximately 40 feet wide by 60 feet long. Prefabricated, metal plate connected wood trusses, spaced at 4+/- feet on centers, clear span the roof (approximately 40 feet, in the east-west direction). Two inch (nominal) wood purlins (laid flat) spaced at 2+/- feet on centers span between trusses and support a metal roof, with ribs spanning up and down the slope. The building is uninsulated. Walls are wood framed, with buttressed, double wall construction at the lower regions to withstand the horizontal pressure from piled sand/salt. Foundations are unknown; however, it appears that a pole foundation may have been used (typical for this type of structure).

Shed No. 2 is a newer, one-story, wood framed storage structure, also with a gable roof. The building is rectangular in plan; approximately 22 feet square. The roof is stick-framed, with tied wood rafters spaced at 2+/- feet on centers, clear spanning the width of the building (approximately 22 feet in the north-south direction). Two inch (nominal)purlins (laid flat) spaced at 2+/- feet on centers span between the rafters and support a metal roof, with ribs spanning up and down the slope. The building is uninsulated. Foundations consist of interlocking, stacked, precast concrete blocks (2 feet wide by 2 feet high by 6+/- feet long), extending 4+/- feet above the floor level. Lateral pressure from piled salt are resisted by gravity forces exerted by the weight of the stacked blocks.

No original construction drawings or previous structural reports were available for the Garage or the Storage Sheds.

## Structural Conditions/Issues – Comments and Recommendations:

Structural conditions at the Highway Garage were observed during a brief tour of the facility on May 13, 2013. Most of the roof and wall construction was exposed to view, except in the Office area. Generally speaking, floor and roof construction in the Garage appears to be performing satisfactorily; there is no evidence of structural distress that would indicate significantly overstressed, deteriorated or failed structural members. Foundations appear to be performing adequately; there are no signs of significant, total or differential settlements. The concrete slab on grade and the 4 feet high concrete wall on three sides of the building appear to be in satisfactory condition.

Structural/structurally related conditions observed during site visit are noted below:

• The condition of the metal panel exterior wall construction and backup steel girt framing system of the Garage appears to be generally satisfactory.

- The capacity of the wood framed Storage Mezzanine framing in the Garage was not determined; however, storage loading appears to be relatively light. Further review/evaluation is recommended in conjunction with future renovations to the building.
- The capacity of the Garage roof framing was not determined (pre-engineered steel framing is a proprietary design); however, roof framing appears to be functioning as originally intended.
- Steel roof framing of the Garage is unprotected and has no fire resistance rating. There are no sprinklers. Fire rating requirements should be reviewed in conjunction with future renovations to the facility.
- The wood framed roof and wall construction of Shed No. 1 and Shed No. 2 appears to be quite light (not uncommon for unoccupied storage building); further review/evaluation is recommended in conjunction with future plans for the grounds surrounding the Garage. The wood buttresses that laterally brace the lower, double wall construction of Shed No. 1 have been overstressed in the past; one brace has noticeably failed.

## **Building Code Requirements and Additional Comments:**

## Massachusetts State Building Code Requirements – General Comments:

Proposed renovations, alterations, repairs and additions to the Brimfield Highway Garage would be governed by the provisions of the Massachusetts State Building Code (MSBC – 780 CMR 8<sup>th</sup> Edition) and the Massachusetts Existing Building Code (MEBC). These documents are based on amended versions of the 2009 International Building Code (IBC) and the 2009 International Existing Building Code (IEBC), respectively.

The MEBC allows the Design Team to choose one of three (3) compliance methods. Structurally, the Prescriptive Compliance Method is preferred. Section 101.5.4.0 of the Massachusetts Amendments (Chapter 34) would require that the existing building be investigated in sufficient detail to ascertain the effects of any proposed work (or change in use) in the area under consideration, and the entire building or structure and its foundations, if impacted by the proposed work or change in use.

## Additions – General Comments:

The design and construction of any proposed additions would be conducted in accordance with the Code for new construction. Significant additions should be structurally separated from the existing building by an expansion (seismic) joint to avoid an increase in gravity loads and/or

lateral loads to existing structural elements. Smaller additions can be structurally attached to the existing building, provided they do not increase the demand - capacity ratio of the existing lateral force resisting elements in the building by more than 10%.

### Renovations/Alterations – General Comments:

Where proposed alterations to existing structural elements carrying gravity loads results in a stress increase of over 5%, the affected element would need to be reinforced or replaced to comply with the Code for new construction. Proposed alterations to existing structural elements carrying lateral load (rigid frames or steel "X" bracing) which result in an increase in the demand - capacity ratio of over 10% should be avoided, if possible. Essentially, this means that removal of, or major alterations to these elements should be avoided. If this is not possible, more significant seismic upgrades/reinforcing will be required; potentially including the addition of lateral force resisting elements (additional "X" braces, etc.).

MECHANICAL, ELECTRICAL, PLUMBING, AND FIRE PROTECTION SYSTEMS

Prepared By:

Consulting Engineering Services 510 Chapman Street, Suite 201 Canton, MA 02021

July 3, 2013

# GENERAL

The mechanical, electrical, plumbing, and fire protection systems were reviewed in conformance with the requirements of the following State and National codes and regulations, as applicable:

- Massachusetts State Building Code 8th Edition
- Massachusetts State Fire Prevention Regulations
- NFPA Latest Editions
- Massachusetts Plumbing Code
- Massachusetts Mechanical Code
- Massachusetts Electrical code (NEC 2011 Edition)
- Illuminating Engineering Society of North America (IESNA) Lighting Handbook
- ASHRAE 90.1 Latest Edition

The scope of this study does not include operational assessment of the fixtures and equipment reviewed; it includes only a brief visual review of the fixtures and equipment. Therefore notes regarding the condition of the fixtures and equipment may or may not be indicative of the actual condition of the systems and equipment and/or the expected life of the fixtures and equipment. Therefore it is recommended that services of a qualified technician be retained to evaluate the actual condition of fixtures and equipment prior to replacement.

## MECHANICAL

## HEATING

An oil fired, gravity vent, hot air furnace located in the mechanical room below the mezzanine serves the adjacent offices and ancillary spaces with overhead ducted supply and returns. This unit comprises a single zone with a dial type thermostat in the main office area. A single 275 gallon oil tank in the same room has local fill and vent connections at the exterior wall of building and fuels this furnace.

Another oil fired, gravity vent, hot air furnace located on the mezzanine within the main garage serves the heated portion of the garages with a single supply trunk down the middle of the space. The unit is controlled from a single dial thermostat in the garage. This furnace is also fueled from the oil tank in the mechanical room below via a separate oil line. Both furnaces tie into a common double wall venting assembly routed through the floor of the mezzanine then up through the roof. Both furnaces are in fair to good condition.

## AIR CONDITIONING

There is no central air conditioning system in the building.

## VENTILATION

The men's and women's bathrooms located below the mezzanine are both exhausted through an inline fan mounted on the mezzanine discharging to a louver in the side of the building. Windows in the office areas are operable and appear to meet the required free area for natural ventilation and there is no form of outdoor air to this building provided mechanically.

The unheated portion of the garage bays includes a large sidewall propeller fan in the corner of the building for general exhaust. This fan is locally switched on or off.

The heated garage bays include (4) ceiling paddle fans for general air circulation that are locally switched on or off. This area also has a vehicle fume exhaust system mounted overhead with (2) hose drops (tail pipe connectors) and a PVC discharge pipe from the fan routed through the back of the building to a wall cap. This system is also locally switched.

## RECOMMENDATIONS

Update heating equipment from oil to gas, saving energy due to better equipment efficiencies and achieve an overall operating savings (if gas is locally available).

Update to programmable type thermostats for control of the furnaces.

Central air conditioning could easily be added for the furnace serving the office areas since the majority of the ductwork is accessible for installation of insulation. Add an evaporator coil on the discharge side of the furnace and provide a split system condensing unit outside the mechanical room piped to the coil. Further, provide a means for outdoor air to this unit by ducting air from a small sidewall intake louver to the return side of the furnace. Provide a motorized damper on this outdoor air intake that opens upon activation of the fan.

Depending on the usage of the vehicle fume exhaust system when the doors are closed it may be prudent to add a toxic gas detection system for the garage area to alert occupants upon a rise in CO and  $NO_2$  emissions which can be life threatening when breathed in by humans at certain concentrations. This type of system can be as simple as sounding an alarm or as complex as energizing ventilation equipment to deplete levels upon detection.

# ELECTRICAL

## EXISTING SYSTEMS

The building is served by a single 200 amp electric service located in an equipment room accessed from the exterior of the building. The service equipment was installed in or around 1995 and is in good condition.

The building also has a 60amp manual transfer switch to which a portable generator is attached via portable cord in the event of a power outage. An existing 10,000w portable generator is stored in the maintenance bays. This generator is in good condition.

The lighting consists of 8' industrial fluorescent fixtures with T8 lamps in the maintenance bays and 2x4 recessed acrylic lensed fixtures in office and other areas. The lighting in the maintenance bays and other areas is adequate.

The exit signs are older fluorescent types without batteries. These fixtures are in poor condition.

The exterior lighting consists of wall mounted high pressure sodium fixtures controlled by a time clock. These fixtures are in fair condition.

## RECOMMENDATIONS

The manual transfer switch should be replaced with an automatic transfer switch and fixed generator. The use of a portable generator presents a safety concern with the dispensing of fuel, etc.

New LED exit signs with integral batteries should be provided to replace the existing.

The exterior lighting should be replaced with a high-efficiency LED type fixture to improve the lighting levels and reduce energy costs.

# PLUMBING

## EXISTING SYSTEMS

Water is provided by a well pump. See the Police and Fire Building study for additional information.

There is a stainless steel kitchen sink with a faucet and hose spray in the break room, which appears to be in good condition. As the water from the tap is not potable (see the Police and Fire Building study) a large bottled water unit is provided for drinking water.

There is an accessible restroom at the front entrance, and both the lavatory and the water closet in this restroom appear to be in good condition. The water closet is a floor mount vitreous china tank type fixture, and the lavatory is a wall mount vitreous china fixture. The water closet is not a low flow fixture.

There also is a second accessible restroom accessed from the service area, and the lavatory, the water closet, and the urinal in this restroom appear to be in good condition. The water closet is a floor mount vitreous china tank type fixture, the lavatory is a wall mount vitreous china fixture, and the urinal is a wall mount flush valve vitreous china type fixture. Both the water closet and the urinal are low flow fixtures.

There is a shower in the restroom accessed from the service area. Both the enclosure and the valve appear to be in fair condition. The valve appears to the pressure balanced type.

There is a laundry tub in the service area which appears to be in fair to poor condition.

There is an air compressor in service area towards the East. It appears to be in good condition. There is no permanent compressed air piping system in the building; hoses only are connected to the compressor.

The water heater is an oil fired tank type water heater that appears to be in fair condition. There is no mixing valve provided with the water heater.

There are no floor drains in any of the service bays.

## RECOMMENDATIONS

The water closet in the accessible bathroom at the front entrance should be replaced by a low flow fixture.

The laundry tub should be replaced.

The existing water heater should be provided with a mixing valve, such that 140°F can be maintained in the tank without the possibility of scalding at the fixtures.

# FIRE PROTECTION

The building does not have a sprinkler system.

Town of Brimfield

# Use of Cost Estimate Information

At study phase we do not know how the Town might package contracts or combine items. Accordingly we price each item in the study as work performed by a General Contractor, requiring professionally designed bid documents and construction oversight & contract administration by a professional design team. These and other factors affect the study direct cost estimates as follows;

An item is added for General Conditions. This is a General Contractor item to cover the cost of all of the items stipulated in a typical construction contract and bid specification including such items as insurance, temporary utilities, site offices, OSHA requirements, and other non-direct costs of performing work that are required of a General Contractor. The percentage used is based on the size of the contract. The smaller the contract, the higher the percentages because fixed costs are spread over a smaller base figure.

An item is added for Overhead and Profit. Again, this is a General Contractor item. It covers the cost of the GC home office, estimating staff, admin staff, and other standard overhead items. It also includes a fair and reasonable profit margin in normal market conditions. Again, the smaller the contract, the higher the percentage is to meet the necessary expenses of doing business.

An item is added for Design & Price Reserve. It is important to note that actual designs put out to bid often vary from design solutions envisaged in studies. A study is conceptual in nature whereas bids are based on fully developed design documents. The full amount of money required will not be known until the contract is complete along with the cost of any extras. It is not uncommon for additional unforeseen work to be uncovered during further design investigation or during construction. Rotted roof deck, rock excavation, code changes requiring a different design solution are all examples of possible additional costs that may be incurred on the design side. On the price side this contingency guards against changing economic conditions and inflationary pressures beyond the norm as the economy improves.

Escalation at a rate of 4% per annum is added from the date the estimate is prepared to update the estimate to its anticipated earliest bid date. This item covers the normal annual increases in union wages and normal annual material price increases. All prices indicated will need to be increased by 4% per annum to their projected bid date over the years covered in this report.

The cost of bonding the General Contractor and his subcontractors is added. The rate of this insurance varies with the size of the contract and the annual construction volume of the winning bidder.

Owner soft costs typically run 30% on public work projects. Soft costs include architectural, engineering, financing, and legal fees, and any other Town-paid pre- and post-construction expenses. Costs are included in each item for a professional design team to fully explore and develop a complete design solution through bid documents, manage the bid process and supervise & administer the construction contract.

The cumulative effect of all of these compounded percentages uplift the total Direct Cost estimates significantly to the total Project Cost estimate.

Whether items are bid to a GC or to a sub-contractor, whether an architectural team is involved, whether wage rates are applicable are examples of how these estimates may vary. It is very important to understand that the procurement method and contract packaging do have a considerable impact on budgeting for the construction, and that the soft cost portion of the estimates should not be allocated to the hard construction budget. Also that the construction bid price is not normally the final construction cost or the total cost of the project when all expenditures are tallied.
